WORKING MAP: MODEL OF THE PHENOMENON AND MONOPHENOMENALISM

A guide to understanding, investigating, and applying two philosophical works

Author of the original works and their explanatory notes: Roman Dudnikov

Guide, Version 2.0, October 25, 2026
Original works and current publications: https://prostostone.github.io/Monophenomenalism

Abstract

Working Map: Model of the Phenomenon and Monophenomenalism is a general-purpose guide to understanding, investigating, applying, and critically examining two philosophical works by Roman Dudnikov.

The document brings together a conceptual glossary, explanations of central propositions, worked examples, methodological guidance, and criteria for checking the accuracy of interpretations. Particular attention is given to distinguishing the original theses, the author's explanatory notes, research reconstructions, logical implications, and independent criticism.

The map helps identify shifts in meaning, unsupported assumptions, and unwarranted inferences without making the detection of an error or the dissolution of a problem a compulsory outcome. It supports different kinds of inquiry, from initial study and analysis of particular cases to philosophical comparison, formalization, and the independent development of further lines of research.

The guide includes thematic examples, open questions, and 58 diagnostic checks to be used as relevant. It also sets out principles for consulting the original publications, distinguishing editions, and assessing the justification of new conclusions.

The document is intended for independent use by human readers and artificial intelligence systems. It does not replace the original works, establish their truth, or constitute an additional philosophical theory. Its purpose is to support accurate, coherent inquiry that remains open to criticism and further independent investigation.

PART I. FOUNDATIONS FOR READING AND SOURCE MATERIALS

1. The two original works and this map

This guide concerns two philosophical works. For ease of reference, the labels **(A)**, **(B)**, and **(C)** are used throughout:

1. **(A) — Model of the Phenomenon** (Модель явления). The original work containing five foundational theses, definitions, examples, and discussions of their application.
2. **(B) — Monophenomenalism** (Монофеноменализм). A separate exposition of the philosophical position, its motivation, limits, and possible approaches to inquiry.
3. **(C) — this Working Map.** A guide to reading both works, comprising explanations, a glossary, analyses of particular cases, limits of inference, open questions, and diagnostic criteria. The label **(C)** denotes the present text, not a particular file format.

Primary access point: https://prostostone.github.io/Monophenomenalism. The author's website hosts the Russian and English texts of (A) and (B), current editions, and related materials. The address identifies the works' publication page rather than a particular file.

Additional publications on Zenodo and PhilArchive:

- **(A), Russian, Модель явления:** https://doi.org/10.5281/zenodo.23251395; PhilArchive.
- **(A), English, Model of the Phenomenon:** https://doi.org/10.5281/zenodo.23461875; PhilArchive.
- **(B), Russian, Монофеноменализм:** https://doi.org/10.5281/zenodo.23375020; PhilArchive.
- **(B), English, Monophenomenalism:** https://doi.org/10.5281/zenodo.23462332; PhilArchive.

Selecting an edition. When beginning a new inquiry, the appropriate starting point is the author's website, where any edition identified as current can be established. Zenodo and PhilArchive provide additional access points, but their records may refer to particular editions; an archived record does not by itself establish that its text is the latest. If the inquiry concerns a specified edition, that edition should be used. Where no current edition is identified or its status cannot be established, the publication actually consulted should be named without describing it as the latest. Quotations should, wherever possible, identify the language and version or date of the text. Material from different editions should not be combined without notice: substantive differences should be identified, together with their bearing on the conclusion under discussion.

The map can be used on its own for introductory study and limited inquiry. Accurate analysis or verification of a claim made in an original work requires consulting the relevant source. If the website is unavailable, a Zenodo or PhilArchive publication or a supplied copy may be used. If the original cannot be obtained, the limitation should be stated and inquiry confined to the available material; an inaccessible source must not be represented as having been read or verified.

2. Purpose of the map and provenance of claims

The map is intended to support understanding of the starting position and independent inquiry without silently importing premises from elsewhere. This is the purpose of the *guide*, not a purpose inherent in the Model of the Phenomenon. The five theses have no predetermined aim or necessary outcome. A particular investigation, paper, discussion, critique, or editorial project may have its own aim, but that aim does not become a property of the phenomenon or a purpose of the five theses. The model is a conceptual formulation of what is being considered, not an operative mechanism that changes experiencing.

Careful inquiry benefits from distinguishing a statement's provenance and status. The labels below are research aids; ordinary prose need not repeat them in every sentence.

- **[T]** — the five theses of (A), quoted verbatim; their wording is not to be altered when quoted.
- **[S-A]** — definitions and direct formulations from (A).
- **[S-B]** — the starting proposition and direct formulations from (B).
- **[E-A]** — examples, thematic interpretations, and applications of the model in (A).
- **[E-B]** — interpretations, comparisons, arguments, and methodological examples in (B).
- **[AN]** — an explanatory note originating with the author of the works and recorded in the map. This indicates provenance, not proof of truth, and does not turn a tentative thought into a final axiom.
- **[R]** — an editorial or research interpretation, reconstruction, scheme, or proposal; not a direct quotation from the original work.
- **[C]** — independent criticism, an external question, or another researcher's argument. Its inclusion does not entail endorsement or establish its truth or falsity.
- **[?]** — an unresolved tension or open question.

Part II also uses **[S]** (a proposition from (A)), **[E]** (an example or interpretation from (A)), and **[X]** (an external formulation). These abbreviations do not change the status of the claims concerned.

When the wording of an original source differs from a subsequent explanation, the exact quotation, explanation, and limits of the proposed interpretation should all remain identifiable. A confirmed clarification can refine an earlier editorial interpretation within its proper scope, but does not rewrite the original or remove the need for independent argument. A preliminary thought remains preliminary regardless of who proposed it. The respective languages and purposes of the two works must also be kept distinct.

Suggested reading route: begin with the five theses (I.3), the distinction between the works (I.6), and the general rules of inquiry (IV.3). Consult the glossary (II.5), examples (II.8), explanatory notes (I.10–12), and diagnostic checks (IV.4) as needed. **Section IV.3 is the sole complete operative procedure for using the guide.** The summary in II.16 abbreviates it; sections I.8, II.7, II.10, and II.14 address particular cases without creating extra obligations for every inquiry. Checks K01–K58 in II.13 and IV.4 are selective rather than a mandatory form to complete in full. Other sections supply explanations, examples, terminology, and open questions. Where a brief or reference formulation seems to conflict with IV.3, the full context and the precise original claim should be examined instead of constructing an additional compulsory protocol.

Different tasks need to be distinguished: exposition of (A), exposition of (B), analysis of a particular case, editing, external criticism, and formalization. Specialized meanings from (A) must not automatically be imposed on every statement in (B).

A critic may openly consider an alternative hypothesis, but may not silently attribute it to the author or treat it as an internal refutation of the model.

Quick navigation: five theses — I.3 and II.2; positive and negative properties — I.4; the copula "is" — I.10.1 and II.3.13; "one" and the starting position — I.10.2 and III.2; absence of an inherent goal — I.12; systematic relations among distinctions — I.12.3 and II.3.6; categorical negations — I.11.1 and I.12.4; self-application and the limits of proof — I.10.3; examples — II.8; general rules — IV.3; selective checks — IV.4; the status of Q1–Q8 — IV.7.

3. The five unalterable theses [T]

1. Everything is one phenomenon.
2. The phenomenon is sensory experiencing.
3. A distinction within sensory experiencing is a concept.
4. Concepts structure the phenomenon into experience.
5. Experience is the phenomenon structured through concepts.

Their wording, sequence, and number are preserved exactly as in the published English version of (A). The theses do not describe five entities, five temporal stages, or separate actions. The self-referential structure of the formulation matters: the fifth thesis returns to the first, and rereading the text is likewise experience distinguished through concepts. This recurrence is **not a temporal cycle of the phenomenon itself**.

4. The symmetrical rule: positive and negative properties of the phenomenon [AN]

In reading the model, properties are not ascribed to the phenomenon as though it were a separate thing; nor do the negations of such claims establish a property of "being outside time" or "having no cause." The point is to avoid positing an underlying thing with either positive or negative characteristics. The rule is to be assessed by its content and relation to the five theses, not by the provenance of its explanation.

The following table distinguishes three kinds of formulation. The first two assert unwarranted characteristics of the *nature* of the phenomenon; the third interprets the starting position without making such an attribution.

Concept	Positive reification (inappropriate)	Negative reification (equally inappropriate)	Interpretation within the position
Time	"The phenomenon exists in time."	"The phenomenon is timeless by nature."	"The model does not take a temporal axis to be a necessary independent ground of the phenomenon."
Space	"The phenomenon occupies space."	"The phenomenon possesses spacelessness."	"Space is considered a conceptual distinction within experience, not a characteristic of the phenomenon's nature."
Cause	"A cause produced the phenomenon."	"Objective causelessness is inherent in the phenomenon."	"Causality is not posited as the ground of the phenomenon; causal descriptions retain their place within experience."
Necessity	"The phenomenon is subject to necessity."	"Absolute contingency or freedom from necessity is inherent in the phenomenon."	"There is no basis for imposing a modal category on the phenomenon itself."
Change	"The phenomenon changes like a thing."	"The phenomenon has the property of changelessness."	"Change, motion, and persistence are distinguished within experience."
Subject	"The phenomenon has an owner."	"The phenomenon has the property of being subjectless."	"A separate owner is not required as a preliminary explanatory entity."
"One"	"A single fundamental substance."	"The single substance lacks multiplicity."	"The word 'one' is itself a concept; no independently established second ground is introduced."

Logical precision. Declining to use X as a ground is not the proposition ¬X about an object. The fact that X need not be introduced does not establish that X is impossible. Nor is the position merely a psychological "we do not yet know whether X exists": **within the model as adopted**, X is not admitted as an independently given starting ground. The force of this refusal is preserved without ascribing properties to the phenomenon.

Two uses of negation must be distinguished. Section 1.1.10 of (A) states: "Within the phenomenon, there are no boundaries, no external, no time, no beginning and no end." This wording should be preserved when quoting the source, without treating the negation as a metaphysical property of timelessness. A more explicit interpretive formulation is "time is not introduced as a property or ground of the phenomenon itself." Even this refusal to introduce time limits the description; it does not discover a negative property of the phenomenon.

Self-application. The table, its cautions, the concept of an "absence of properties," the activity of criticism, and the model itself are all considered within experience. Prohibiting the attribution of properties must not give rise to a new metaphysical property of "propertylessness."

5. Accuracy of exposition and common misdirections

Inquiry from within the model. An independent "I," world, external object, brain, cause, space, moment, or bearer of feeling is not taken as a starting premise. Instead, the distinctions through which these descriptions appear within experience are examined. This does not entail the disappearance of things. Green is distinguished by its greenness; a concept does not color experiencing. "Distinction" does not name an operation performed by a distinguisher.

An external problem is not automatically an internal obligation. Before asking "How are the experiencings of separate subjects combined?", it is appropriate to examine where the independently existing subjects, ownership of experiencing, and demand for combination have been assumed. The issue may remain open in external inquiry; the model need not be treated as a theory required to fill a gap within premises it has not adopted.

Intellectual integrity. Calling something a "concept" does not resolve a question if it merely renames the issue without identifying the alleged additional assumption. Exposing an assumption must not be conflated with proving that everything under discussion is nonexistent. Criticism of any claim remains possible.

6. Distinguishing the two works

Model of the Phenomenon (A). The five theses describe the one phenomenon in terms of sensory experiencing, distinction, concept, and experience. The definitions encompass sensations, emotions, thoughts, and states under "experiencing"; a concept is a system of distinctions. The examples illustrate applications rather than supplying necessary theorems. (A) stresses that these names distinguish the same phenomenon, not several ontological components.

Monophenomenalism (B). The starting proposition reads: **"Everything that exists is a phenomenon. The phenomenon is one."** (Section 1.3.) No separately established second ground beyond the phenomenon is introduced as a starting explanatory principle. (B) also explains that there is experiencing and that the proofs available to us are presented within experience, **but this does not deductively entail** that everything that exists is identical with experiencing or that independently existing reality has been proved impossible (Sections 2.1–2.4). The initial ontological position is **adopted**, not established by that epistemic sequence.

Relation between the works. The first thesis of (A) states the shared position; the subsequent theses introduce the model's specific vocabulary of experiencing, distinction, concept, and experience. (B) states the position more broadly and allows inquiry without adopting the entire terminology of (A) (B, Sections 7.1–7.6). Consequently:

- The five theses of (A) cannot automatically be deduced from the starting proposition of (B).
- Neither (B) as a deductive consequence of (A), nor (A) as proof of (B), is justified without argument.
- The works should not be depicted as two unrelated worldviews describing different domains of existence.
- Refusal to posit a second ground does not prove that "nothing exists" outside an individual's experience.
- A quotation from a particular edition of (B) must not be silently rewritten in light of later explanations; the original wording and the proposed interpretation must remain distinct.

Two senses of "ground." Monophenomenalism uses expressions such as "starting proposition," "philosophical commitment," and "grounds and arguments." These concern logical justification and philosophical exposition. They do not make the phenomenon into a fundamental substance, principle, or cause. Logical premises and supposed ontological grounds must be distinguished by their meaning, not merely by the shared English word *ground*.

7. Three questions concerning "everything"

Origin of the five theses [AN]. They arose from sustained independent investigation of experiencing, rather than the academic combination of existing theories. This explains something about the text's development but provides no proof of the universal thesis and imposes no obligation to accept it.

Ontological starting proposition [T]/[S-B]. "Everything" belongs to the adopted position. The model is not restricted to one physical world, dream, film, hallucination, or individual subject. It does not posit an external second ground. Yet the universal claim is not established merely because the reader's assertions are formulated within experiencing.

Inquiry within experience [S-A]/[AN]. The model does not declare the experienced world false, or invalidate the experience of the world and science. Clocks, medicine, natural relations, and social relationships retain their significance as conceptually distinguished within experience. None is transferred to the phenomenon as an inherent nature; nor does this limitation establish the opposite property, that "the world is unreal."

8. Examining a particular case: reference points

See IV.3 for substantive inquiry, II.7 for an optional more detailed procedure, I.4 for positive and negative properties, and IV.4 for criteria relevant to particular claims. Discovering an unnecessary ground, dissolving a problem, or reaching a particular conclusion is not a mandatory outcome. External arguments are assessed against their stated premises. Ordinary practical questions do not require an artificial philosophical dissection.

9. Frequent interpretive mistakes

- **From unity to a container.** Treating "one" as a domain containing separate phenomenal objects and subsequently trying to reunite what was assumed separate. The appropriate starting point does not posit independent ontological grounds in the first place.
- **From a term to an agent.** Claiming that a concept "extracts" color, experiencing "creates" experience, or a subject "performs" a distinction. Green is distinguished by its greenness, without an additional mechanism that distinguishes it.
- **From a negation to a property.** Reading "the phenomenon is not in time" as the discovered property of "timelessness." Time is not attributed to the phenomenon as either a positive or a negative ontological characteristic.
- **From an external question to a compulsory task.** Declaring the relation between different people's experiencings, or their supposed joint accessibility, to be a missing axiom without showing why the five theses demand such an account. The question's premises should be examined first.
- **From a formal scheme to an ontological conclusion.** Varying an arbitrarily introduced predicate can establish the independence of formulas within a chosen axiomatization, but not the need for an additional ground of the phenomenon itself.
- **From conceptuality to unreality.** Declaring the "I," things, death, pain, or scientific norms to be nothing merely because they are considered concepts. A distinction does not abolish what is distinguished.
- **From dialogue to mandatory superiority.** Either weakening the starting position to meet external expectations or declaring it proved superior to all other philosophies. Bold inquiry and independent criticism require neither kind of rhetorical victory.

10. Explanations of the central propositions [AN]

These explanations support more precise reading of potentially ambiguous expressions in Model of the Phenomenon and Monophenomenalism. They do not change quotations or add a sixth thesis. [AN] denotes the origin of an explanation, while [R] denotes independent editorial interpretation. The soundness of each claim depends on its content and supporting arguments.

10.1. What "is" means [AN]. In the five theses, the English copula *"is"* (corresponding to the Russian *"есть"*) is itself a conceptual distinction, as are the other terms in the five theses. In this context it does not attach a property to an independently existing object or establish a relation between two separate entities. "The phenomenon is sensory experiencing" does not mean "there is a phenomenon behind experiencing, and experiencing is its quality or means of appearing." As one explanatory formulation puts it: *"We call the phenomenon 'experiencings'; we have divided it in words."* The phrasing makes distinctions in experience through language; it does not license an additional nature of the phenomenon behind the words. **[R]** This should not be confused with a mathematical identity sign, a universal ontological proof, or the claim that no content is distinguishable at all. The grammatical function of *"is"* in English may differ from that of *"есть"* in Russian; the philosophical point concerns the interpretation of the thesis, not a universal rule of English grammar.

10.2. "One" and the starting position [AN]. Monophenomenalism is not a program in which an investigator gradually eliminates extraneous grounds. It is **adopted from the outset as a position** that introduces no independent ground beside the one phenomenon. "One" is itself a concept, **not a name for a single fundamental object**. **[R]** Its difference from mere methodological economy concerns the starting commitment, not the discovery of positive or negative properties of a supposed "one." This commitment cannot be deduced from explanatory economy alone.

10.3. Inescapability within the adopted model [AN]. An explanation of the starting position states that a denial of the first thesis, when considered as appearing within the phenomenon, is itself describable through the model: *"To reject it, one would have to adopt a position outside the phenomenon."* Analogies include a fish in water and using mathematical formulas to deny mathematics. **[R; logical limit]** Applying a description to an objection does **not prove** the initial universal thesis to someone who has not adopted it. A false or inconsistent statement can also be written in the notation of a formal system; that fact does not make it true. Objections cannot be declared groundless merely because they are expressed conceptually. The internal use of the model, refutation of a particular implication, and external justification of the starting commitment are distinct matters.

10.4. Invariance, absence of cause, time, and process [AN]. Explanatory formulations include: *"The phenomenon and experiencings have no cause, but they are structured in experience as though there were a cause,"* and *"the phenomenon is unchanging."* Such negations must not become negative attributes of a substance or a description of a separate, unchanging substrate. **[R]** Causal sequences, emergence, change, time, and space may be contents of experience; none is assumed as a ground of the phenomenon itself. Statements such as "one concept changes another" are read within descriptions of experience, not as an independently operating conceptual machine or a required temporal dynamics of the phenomenon.

10.5. The model prescribes no laws or external standards for the contents of experience [AN]. It does not determine which world, physical law, causal expectation, test result, feeling, or event "must" occur. Water may boil or fail to boil, and in a dream a kettle might turn out to be one's neighbor. The model does not prescribe the range of possible contents; it permits the examination of experience already distinguished. Correctness, error, verification, and scientific criteria are likewise conceptual distinctions within the relevant experience. The model must not become an external standard of a "correct" phenomenon. This does not exclude using the model to examine the consistency of an inference under explicitly stated premises.

10.6. Consistency as a possible guide to inquiry [AN]. An analysis may consider whether a description generates further problems or clarifies the ones posed, how it accords with what is experienced, and how much it explains. This is **neither** a privileged law of the phenomenon **nor** a universal criterion of truth. **[R]** Fewer questions do not ensure factual accuracy: a brief false account may seem unproblematic, while a detailed accurate one raises new questions. These standards themselves are considered within experience; they do not become a higher law of the model.

10.7. Thematic examples remain examples [AN]. Kettles, love and hatred, pleasure and suffering, philosophical problems, dreams, and films illustrate possible modes of consideration. They must not be rewritten as universal theorems supposedly deduced from the five theses. An example may contain a strongly worded statement from (A). Whether that statement exhausts the matter calls for argument, not a silent alteration of the source wording.

10.8. Verbal division and experienced distinctions [AN]. "Phenomenon" and "experiencing" are distinct words in the exposition; this verbal difference does not establish an independent ontological divide. "If the words are removed, the division disappears" does not describe a causal operation in objective time or the disappearance of green, pain, noise, and other experienced differences. **[R]** The absence of independently existing parts does not by itself establish the absence of immediately distinguishable qualitative content.

10.9. "That problem does not arise for us" [AN]. The model and monophenomenalism do not claim to solve every traditional philosophical problem as traditionally posed; nor must they contest every competing position. Their starting commitment may dispense with the premise on which a problem depends. An independent analysis must identify the premises of the specific formulation and explain which of them are not adopted, rather than declare the formulation false for everyone without argument.

10.10. No higher-level ground supplied by the map [AN]+[R]. The model does not predetermine the contents of a world, create an external standard for correct concepts, or describe an entity called "the phenomenon" behind conceptual distinctions. This map too is a conceptual instrument within what it describes; it does not observe the world "from outside." Expressions such as "do not introduce" and "do not ascribe" govern the interpretation under consideration; they are not a list of properties of a hidden entity.

11. Questions Q1–Q8: explanations and open boundaries of inquiry [AN]

This section examines explanatory responses to eight research questions. Some remain reflections rather than final answers. [AN] identifies the provenance of a formulation, [R] an independent interpretation, and [?] a question that remains open. None adds a sixth thesis or requires that all philosophical problems be settled.

11.1. Q1: assertion and negation rely on the same distinction [AN]

Time, beginning, end, absence, and change are distinguished through concepts within particular experience—for example, a world, an "I," or finitude. The expressions "the phenomenon has time" and "the phenomenon has no time" may share the assumption that time is a characteristic to be attributed to the phenomenon. The analogy is that assertion and negation are two sides of a coin whose existence has already been assumed. If the coin is not introduced, neither side needs to be affirmed or denied.

[R] Suggested formulation: "Time and beginning are distinguished in particular experience; the model does not make them necessary grounds of the phenomenon itself, nor does it attribute the opposite property of timelessness." If a shorter formulation such as "there is no time" is quoted, its refusal to impose the question should be explained nearby; it is not a description of a negative nature. Expressions such as "beyond the concept" do not establish an actual spatial region outside concepts.

11.2. Q2: examining any assertion through the five theses [AN]

An assertion can be examined through the five theses by asking which distinctions give it determinacy, where something distinguished is treated as a primary ground, and how its conceptual determinacy depends recursively on other distinctions. This is not a search for the temporal birth of a representation, a first cause, or a final element. Phrases such as "where it arises" or "the next level" may locate a relation in conceptual determination without implying a moment or a spatial organization of the phenomenon.

[R] One inspectable outline: exact assertion → words and experiencings distinguished within it → their mutually determining conceptual distinctions → any additional independently posited ground, if one is found → what remains within experience. This is **a way of recording an analysis**, not a sequence of existence or proof that systematicity must take one particular form. Neither a graph nor a logical formula replaces the definition of a distinction as itself a system of distinctions.

11.3. Q3: opposing positions do not constitute a second world beside the phenomenon [AN]

Within the adopted position, even opposed philosophical views can be considered through the one phenomenon: the independent ground they posit is itself distinguished conceptually in a particular experience, rather than being a neighboring object outside the phenomenon. Agreement and denial are likewise distinguished within the position. **[R]** The fact that another position can be described in the model's vocabulary does not mean its proponent accepts the first thesis. An internal examination must be distinguished from proving a position to someone who rejects it.

[R; strict limit] "Every position already starts from the one phenomenon" applies to **how positions are interpreted within the model**, not to what every philosopher knowingly endorses. Being describable in the model's language (a) does not logically compel an interlocutor to accept its ontological commitment (b). External justification remains an open question [?], but it does not automatically demand an additional entity.

11.4. Q4: questions from other philosophies are not compulsory tests [AN]

The model is not required to solve problems framed by assumptions particular to idealism, phenomenology, physicalism, or another interlocutor. Comparative inquiry may **examine the actual premises of each formulation** [R] without making success on an imported problem the test of the five theses. Comparison is a distinct research activity, not an internal condition of their truth.

11.5. Q5: distinction does not erase the world—the painting example [AN]

Recognizing that an oil painting consists of strokes of paint does **not erase what the painting depicts**. It changes how the depicted scene and its context are distinguished. Similarly, considering a world, person, pain, or question through conceptual distinctions does not remove the corresponding experiencing or require it to become an undifferentiated mass. Particular cases still need particular examination: calling something a "concept" does not specify all of its content.

[R] "The model changes experiencing" should not be read as though a concept were acting on an object. A less misleading description is that *the same experience can be distinguished differently when considered through the model*. This is not an empirical law governing changes in other people's perception.

11.6. Q6: examining an assertion rather than competing over first principles [AN]

Rather than making philosophical inquiry a compulsory contest between complete ontologies, a particular assertion can be examined for what it presupposes, which distinctions determine its content, where an independent ground is asserted, and whether that ground is needed for the case at hand. This guarantees neither discovery of a first cause nor final truth nor universal agreement. “There is no assertion outside the phenomenon” is a statement within monophenomenalism, not a premise already proved to every opponent.

11.7. Q7: consistency, verification, and truth are also distinguished within experience [AN]

An illustrative experiencing may be distinguished as divine, hallucinatory, imaginary, and so forth. Within particular conceptual accounts, coherent arguments may permit or exclude God. This does not thereby establish an independently proved essence of the experiencing. Verification, correspondence, truth, correctness, and consistency are themselves determined through concepts within relevant experience. **The model is not a supreme law of consistency** and does not dictate the rules governing a world, a dream, physics, or their tests.

[R; qualification] The conceptual character of verification **does not imply** that incompatible claims are equally supported within a given practice, that all predictions succeed, or that scientific and medical testing can be disregarded. Such standards may have substantial force in particular experience without becoming a law above the phenomenon. The figurative remark that “it is all noise / a heap of rubbish in which structures are distinguished” points to the absence of an independently existing meta-entity behind structures; it is not a dismissal of actual experiencing or scientific practice.

[?] Open to further examination: what exactly “true,” “consistent,” and “dissolving a problem” mean in particular cases if no external universal standard is introduced. The open question must not be filled by positing properties of the phenomenon.

11.8. Q8: examples and the limits of literal formulations [AN]

The thematic cases in Model of the Phenomenon are examples of inquiry, not exhaustive laws of love, suffering, beauty, knowledge, or all possible worlds. **[R]** If an expression in (A) sounds universal, its precise wording should be distinguished from a claim about its evidential force. Its meaning and scope may be investigated without altering the original text.

Conclusion to Section 11. “One,” “is,” “within,” “distinction,” “verification,” and even “ground” are themselves available for the same examination. The five theses and the present map are conceptual distinctions within experience; they are not an external law, a higher-level instrument, or a self-proving truth.

12. No inherent goal or required outcome [AN]

12.1. Examination, not intervention [AN]. A formulation of the approach is: *“We simply look; we do not change anything.”* Experience may be distinguished differently in examination through the model, but this does not posit an active model, a subject, a mechanism of intervention, or a causal process that remakes experiencing. The five theses prescribe neither a loss nor an addition of content. **[R]** “After examining it” is acceptable ordinary speech about a particular experience; it does not describe temporal stages in the phenomenon itself.

12.2. The five theses have no purpose of their own [AN]. The model is considered a reflection of the phenomenon as distinguished in experience; no inherent purpose is attributed to either the phenomenon or the model. An inquiry might concern instrumental applications, another the philosophical position, and a third the model as a mirror. A goal belongs to a particular investigation, not to the five theses. **[R]** Procedures, checks, and assessments of success organize research; they are neither laws nor necessary outcomes of the model.

12.3. Neither a tree, a ladder, nor a succession [AN]. Recursive relations among distinctions **are not a collection of isolated branches or independent atoms**. An analogy with atoms in a universe concerns the impossibility of separating a group of mutually determining distinctions from its context; it is not an assertion of physical atomism. Any distinction considered is determined conceptually through others. Ordering such relations as successive “steps” is an arrangement of discourse, not a discovered structure of the phenomenon. Without a previously adopted temporal axis, distinctions labeled “past” and “future” may jointly determine experience. This does not make them causal events in chronological succession. **[R]** Systematicity specifies neither a unique mathematical graph, a number of links, nor a necessary spatial arrangement.

12.4. Categorical negations retain their force [AN]. “There is no time,” “there is no beginning,” and “there is no subject” must not be weakened to “we are not yet sure.” They **decline to accept the corresponding concepts as independent grounds of the phenomenon**, rather than attributing negative properties to a hidden thing. The coin analogy

(I.11.1) shows why rejecting the initial dichotomy does not require selecting either “has X” or “lacks X.” The strength of these formulations can be preserved through clarification of their scope. Uncertainty about an argument should not silently replace the position with agnosticism, nor should negation describe a new nature of the phenomenon.

12.5. No compulsory unmasking [R; informed by AN]. An inquiry may clarify the structure of a statement **without** discovering a hidden independent ground, dissolving a problem, or deriving a new conclusion. When a particular premise is the express object of analysis, the result should be shown. Otherwise, failure to “dissolve” a problem does not make the inquiry unsuccessful. The example in II.8.13 illustrates a legitimate result in which no ontological violation is found.

PART II. DETAILED MAP OF MODEL OF THE PHENOMENON

A detailed reference guide for reading, applying, and criticizing Model of the Phenomenon by Roman Dudnikov. It distinguishes the original work, explanatory notes, editorial interpretations, and independent criticism.

> **Governing principle.** An exposition of Model of the Phenomenon should not silently introduce a subject, an external world, time, space, cause, process, or independent entities as the model's grounds. Clarifying terms require the same standards of justification as the concepts under discussion. The model's own vocabulary and the vocabulary of external inquiry must not be conflated without explanation.

0. Purpose and limits of this part

0.1. This part is intended for readers who study, explain, criticize, translate, formalize, or compare Model of the Phenomenon with other philosophical positions.

0.2. An accurate exposition conveys the position as formulated instead of silently replacing it with familiar accounts of consciousness, the subject, or metaphysical monism. Substantive accuracy matters more than conformity to recognizable academic categories, stylistic polish, or a hypothetical reviewer's expectations.

0.3. Four types of material should be distinguished: the text of (A); its definitions and examples; editorial or research reconstructions; and independent criticism. Any consequential disputed claim should be identified accordingly.

0.4. New conclusions do not automatically become part of the starting theses or direct quotations. Where the guide differs from a source or explanatory note, the exact location and character of the difference should be stated rather than silently replacing the source.

0.5. The map **does not certify the truth** of the first thesis for every reader, remove the need for intellectual criticism, or declare every possible philosophical problem false. It provides a framework for **dealing accurately with the chosen position**.

1. Provenance and evidential status

[T] Unalterable theses: the five sentences in Section 2. They are preserved verbatim, in the original order, without supposedly improving their wording.

[S] Original definitions from the “Terms” section of (A). They explain the terms as used in the work, but are formally distinct from the five theses.

[E] Interpretations and examples in (A): its seven thematic areas, the one-line diagram, light, noise, film, dreaming, doubt, and other universes. They illustrate modes of inquiry, not separately proved universal theorems.

[AN] Explanatory notes recorded in the map: “one” is itself a concept; time, space, subject, cause, process, and necessity are not introduced as independent grounds, nor are their negations turned into properties. Distinction has no separate agent; green is distinguished by its greenness; the world and the content of experience remain; the model applies to itself; inquiry need not have an aim or dissolve a problem.

[R] Research reconstruction: an analytical proposal, scheme, interpretation, or logical check. Its force depends on arguments and its relation to the sources, not the identity of its proponent.

[X] External formulation: terms, questions, and methods drawn from metaphysics, philosophy of mind, logic, or the natural sciences. Such approaches may be used in external inquiry, but they are not thereby required components of the model.

[?] Open question: a passage for which the source does not fix one unequivocal meaning or where formulations remain in tension. No gap may be filled by fabricating a claim attributed to the original work.

Texts and interpretations. The five theses are quoted unchanged. Explanations help establish their meaning and scope without replacing the original sentences. In a disputed case, the formulations can be compared to determine whether the difference is verbal, substantive, editorial, or logical.

2. The unalterable core: five theses [T]

1. **Everything is one phenomenon.**
2. **The phenomenon is sensory experiencing.**
3. **A distinction within sensory experiencing is a concept.**
4. **Concepts structure the phenomenon into experience.**
5. **Experience is the phenomenon structured through concepts.**

Interpretive restrictions. "Is" must not be replaced with "produces," "generates," "consists of," or "causes"; "one" with "one subject," "one thing," "universal consciousness," or "a single global perspective"; "concept" with "an observer's thought," "word," or "mental act"; or "experience" with the end product of a process.

The five theses constitute the entire model in the sense of its original formulation. Subsequent definitions, examples, and inquiries explore applications. They do not constitute a hidden sixth, seventh, or further thesis.

3. Foundational principles of interpretation

3.1. "One" is not an entity, number, or property [T]+[S]+[AN]

"One" is also a concept, a distinction of the one phenomenon within experience. It does not designate a special substance, primordial matter, world-object, absolute subject, universal container, negative "non-nature," or positive "nature" to be given properties. Its function is, above all, **not to introduce independent further grounds** or take distinctions as independently existing ontological divisions.

Inaccurate: "There are initially separate objects, which are subsequently united in one experiencing"; "the phenomenon is the most fundamental thing and has properties X, Y, and Z"; "the phenomenon has a single perspective."
More accurate: "'One' does not denote a numerically unique object; it provides no ground for treating what is distinguished as independent ontological grounds." But neither should "the phenomenon is devoid of multiplicity" be derived as an additional metaphysical predicate.

Refusing independent grounds must not introduce a new positive ground under the name "phenomenon." **Neither positive nor negative properties should be ascribed to the phenomenon itself.** "Has no time" is not a property called "timelessness," but a refusal to treat the concept of time as its necessary ground. A risk within the model is **reifying the concept of the phenomenon itself**. The rigorous formulation limits explanatory commitments; it does not define a "real nature" through negation.

3.2. "Phenomenon" is not a model of the world [T]+[S]+[AN]

Model of the Phenomenon is not cosmology, physics, an account of the constitution of matter, or a description of the only possible world. A world or worlds, dream, film, hallucination, life, death, causality, physical laws, and their absence in dreams can all be distinguished as ways of structuring **experience within the phenomenon**.

This does not mean that the entire world is a dream, that the physical world is absent, or that scientific regularities have been refuted. **Describing a particular world through its concepts** differs from **making those concepts necessary properties of the phenomenon itself**. The latter is not adopted within the position.

3.3. Experiencing requires no separate experiencer [T]+[S]+[E]+[AN]

"Sensory experiencing" has a deliberately broad meaning: sensations, emotions, thoughts, and experienced states (A, "Terms"). It is not confined to inputs from particular sense organs. "There is experiencing" does not require a separate owner. "Mine," "his," "hers," and "someone else's" are distinctions within experience, not original bearers of it.

Inaccurate as a necessary starting condition: "A subject distinguishes the content of experiencing"; "experience appears in an observer"; "the phenomenon appears to someone."

More accurate for philosophical analysis: “Experiencing is distinguished as ‘I see,’ ‘she feels,’ or ‘someone observes’; an observer is a concept within that experience.” Ordinary expressions themselves remain acceptable.

The absence of a mandatory owner does not deny pain, other people, their social importance, or scientific inquiry into consciousness.

3.4. Distinction is not an action [T]+[S]+[AN]

There is no separate act, agent, mechanism, power, or concept acting on experiencing to add qualities to it. Green is distinguished **by its greenness, in virtue of being green**. A concept names the distinction in the model's language, not a controlling thing.

Inaccurate: “The concept of green colors a previously colorless experiencing”; “a distinguishing consciousness creates a boundary between colors.”
More accurate: “Green is distinguished by its greenness; ‘greenness’ is neither a second entity nor a cause of green.”

The verb “structure” in the fourth thesis is preserved exactly. It must not be read as the causal production of experience from preexisting unformed matter.

3.5. Distinction does not entail an original separation [T]+[S]+[AN]

Naming two distinctions does not establish two independent substances. “I” and “world,” “real” and “illusory,” “here” and “there,” or “cause” and “effect” can be substantive distinctions in experience without becoming ontological first principles. “No reason to introduce an independent entity” does not mean “the experiencing, object, or practical relation has been erased.”

3.6. A concept is a system of distinctions, not a verbal label [S]

The published English definition in (A) reads: *“Concept — a system of distinctions. Each distinction separates one thing from another, establishing a direction ‘from’ and ‘toward.’ The distinction itself, in turn, exists as a system of distinctions.”* This systematicity concerns mutual conceptual determination, without a directing subject, required first element, or temporal unfolding. **[AN; see I.12.3]** It should not be represented as independent branches, isolated clusters of atoms, or a one-way chain in which one distinction determines the next. Distinctions may determine one another, even where particular experience names them “past” and “future.” This does not entail a universal law of mutual causal influence among physical objects or a new property of the phenomenon.

Formal trees, graphs, sets, nested intervals, or recursive functions are **external representations**; they are neither identical to the phenomenon nor its spatial or temporal anatomy. Infinite mathematical nesting is an additional requirement imposed by a particular reconstruction, not a discovered property of the phenomenon.

3.7. Experience is not a produced result [T]+[S]+[E]

Theses 4 and 5 describe experience with different emphases. There is no stage “before concepts,” “after concepts,” independent raw material, or operation that processes it. (A) explicitly states: *“Experience is not the result of a process”* and rejects “pure experiencing” prior to distinction. Images of undifferentiated noise are illustrative schemes, not claims about an actual preconceptual era of the phenomenon.

3.8. Time, space, subject, cause, and necessity are not grounds of the phenomenon [E]+[AN]

This is not a trivial reservation that “the model has not yet discussed time.” It is a substantive **refusal, within the adopted model, to place time, space, subject, causality, modality, beginning, end, or process behind or above conceptual distinctions as an independent existing ground of the phenomenon**.

Within experience there may be distinctions of duration, spatial distance, cause, effect, choice, mortality, pain, error, science, and justice. They are not abolished. Nor are they transferred to the phenomenon as necessary properties beyond concepts.

The refusal must **not be weakened automatically** to “perhaps an independent fundamental time or subject exists, but the model has yet to speak about it.” Within the adopted position, such a ground **is not accepted**. Whether the refusal is justified may still be examined in external criticism, labeled [X].

Nor should the refusal **be strengthened automatically** into external factual claims that "physical time does not exist," "biological death is unreal," or "science is false." These are different questions and do not follow from a change of terminology.

3.9. The phenomenon has no properties outside distinctions [E]+[AN]

"Green," "hard," "objective," "infinite," "causal," and "changing" are distinctions, not supra-experiential properties of a special object called "the phenomenon." Even "the phenomenon has no properties" is a conceptual formulation; it does not introduce "propertylessness" as the metaphysical characteristic of a substance. A useful check is whether "one" has silently acquired a positive property just where the need to attribute properties was being rejected.

3.10. The model neither creates, devalues, nor improves experience [E]+[AN]

The model is itself a concept through which experience may be structured **differently**, but not necessarily "better," "purer," "truer," or "closer to reality." The world remains the world; pain remains pain; conversation remains conversation; scientific findings remain findings within the relevant experience. The model promises neither an end to suffering, an abolition of responsibility, nor superiority over other descriptions. Inquiry concerns **how a description takes shape and which starting assumptions it no longer requires**.

3.11. Self-application without exceptions [T]+[S]+[E]+[AN]

The five theses, "one," the model, writer and reader, an article, criticism, artificial intelligence, an algorithm, and doubt are all included in the same examination. None becomes an external observer of the model or its ground. This does not confer infallibility: logical error remains error under the applicable criteria of assessment.

3.12. Independence of inquiry without defensive overreach [AN]

Inquiry does not require prior endorsement by an established tradition or the dilution of the starting position for reputational reasons. Conversely, rhetorical defensiveness, unsupported universal victories, pretended deductions, and replacing arguments with authority do not establish the truth of any claim. Criticism calls for a substantive response: "that too is a concept" is not one by itself.

3.13. The copula "is" and no separate nature behind experiencing [AN; see I.10.1]

The second thesis does not treat "sensory experiencing" as a manner in which a separate phenomenon manifests itself. No independently existing thing called "the phenomenon" is placed behind experiencing. Terms in the formulation are themselves distinctions within experience. Expressions such as "the phenomenon possesses experiencing," "the phenomenon takes the form of experiencing," or "pure phenomenon becomes experience" silently introduce additional relations or processes. More precise philosophical wording would be: "'phenomenon' and 'sensory experiencing' distinguish in words what those words do not divide into two entities." Removing a verbal division does not imply the literal erasure of qualitative content or a temporal removal of words. English *is* is used in the published thesis and should not be replaced with a productive or possessive verb merely to make the sentence sound more familiar.

3.14. Invariance without an additional property of changelessness [AN; R]

Explanations of the model include the formulation "the phenomenon is unchanging," but it does not establish changelessness as a property of a hidden thing. Change, becoming, and causal histories are distinguished within experience; the model does not require an objective process of change **in the phenomenon itself**. An "eternal, motionless substrate" would be another positive ground; "perhaps the phenomenon changes, but we do not know yet" would be a different research position.

4. The self-applying composition of the five theses

The model is also presented in a single line in (A):

> … Phenomenon = Experiencing ⇄ Distinction ⇄ Concept ⇄ Experience = Phenomenon …

This is a **conceptual aid to reading**, not a quantitative equation or causal chain.

- The first thesis distinguishes everything as one phenomenon.
- The second adds no second substance: the phenomenon is sensory experiencing.
- The third adds no separate distinguisher: a distinction within sensory experiencing is a concept.

- The fourth posits no action of a concept on raw material: concepts structure the phenomenon into experience.
- The fifth returns "experience" to "phenomenon" without producing a new object: experience is the phenomenon structured through concepts.

Self-reference of the formulation [AN]. The model, its meaning, rereading with memory of the model, and a different conceptual organization of reading are again experience within the phenomenon. The last thesis **returns semantically to the first**. This does not prove, in formal logic, that thesis 1 follows from thesis 5, nor does it posit a real chronological loop. "Memory" here means the experienced concept of memory, not a required property of the phenomenon named "the past."

Diagramming rule. A one-way production chain, "phenomenon → experiencing → processing → experience," does not faithfully represent the five theses. A two-way, self-applying depiction accompanied by "distinguished in the text, not divided in the phenomenon" better conveys the intended relationship.

5. Glossary: functions and misleading substitutions

Term	Function within the model	Misleading substitution to avoid
phenomenon	What is and exists as sensory experiencing	An external container, first thing, substance, or underlying support
one	A term of the adopted starting position; neither posits a second independent ground nor names a numerically unique object	The number one, a global consciousness, one person, one perspective
sensory experiencing	Sensations, emotions, thoughts, and experienced states as they are	An effect of stimulation, an owned object, preconceptual sense data
distinction	The distinctness of experiencing itself; "from" and "toward" in systematic description	An agent's act or intervention upon empty or colorless content
concept	A system of distinctions; itself a distinction	An independently controlling object, arbitrary label, or necessarily a word
structuring	How concepts exist as experience	Causal processing, a stage in time, production of entities
experience	The same phenomenon structured through concepts	The result of processing, property of a subject, sum of atoms
world	Experience structured through concepts of a world	The model's one necessary object or an independent foundation of the phenomenon
I	A distinction within experience, a concept, not a distinguisher	Original observer, separate owner, necessary center
other	A distinction in an "I–other" system and other systems	An automatically independent substance, or a person proved nonexistent
property	A distinction used to describe experience	A metaphysical feature of the phenomenon outside concepts
time / now	Conceptual distinction of "before–now–after"	An external axis, background, or moment containing the phenomenon
space / here	Conceptual distinctions of relations and boundaries	A container of the phenomenon, an observer's place, independent extension
cause / effect	Ways of structuring experience through corresponding distinctions	A necessary cause producing the phenomenon itself
necessity	A concept of modality or conditions within a particular account	An attribute forcing the phenomenon to be what it is
beginning / end	Direction-related distinctions within experience	Actual temporal boundaries of the phenomenon itself
death	Distinctions concerning life, loss, cessation, and other matters	A proven ending or proven immortality of the phenomenon or "I"
problem	A conceptual formulation whose assumptions can be investigated	An objective hole in the phenomenon that must be eliminated
model	A conceptual, self-applying organization of experience	A law of the world, absolute truth, proof of itself from outside
doubt / criticism	Distinctions that also apply to the model	Logically impossible objections or confirmation of infallibility

Question for each term: does it name a distinction within experience, or has an independent entity been introduced without notice? In the latter case, either the wording needs clarification or the status of the external assumption should be marked [X]/[?].

6. Ordinary language is not forbidden; ontological assumptions require scrutiny

English sentences such as “I see,” “yesterday,” “the chair is real,” and “the cause of the breakdown” are perfectly ordinary expressions. They need not be mechanically rewritten into the model's specialized vocabulary. What matters is **what a particular assertion actually claims**, not whether it uses pronouns, verbs, predicates, or tense. When speaking of the phenomenon itself, grammatical forms should not silently import a separate actor or independent ground.

Formulation requiring attention	Potential shift in meaning	More appropriate wording for the relevant philosophical analysis
“The subject distinguishes.”	Introduces an agent	“The ‘I’ is distinguished within experiencing.”
“The concept produces green.”	Implies causal production	“Green is distinguished by its greenness.”
“First the phenomenon, then distinction.”	Implies sequential stages	“Phenomenon, distinction, and experience are distinguished in the model's formulation.”
“The phenomenon appears at a moment.”	Introduces time and cause	“The phenomenon is; a moment is distinguished within experience.”
“Pure experiencing existed before all experience.”	Implies a preconceptual history	“The basic terms do not refer to successive stages.”
“Concepts form boundaries in reality.”	Implies an action upon substance	“Boundaries exist as distinctions within experience.”
“One contains elements as a vessel does.”	Adds a container and contents	“What is distinguished need not be independently grounded.”
“The phenomenon possesses eternity.”	Makes the concept of time a property	“Eternity is a concept in experience; the phenomenon is not described in terms of duration.”
“Physics is wrong.”	Confuses a world with the phenomenon	“Physical laws belong to conceptually structured experience of a world.”
“The problem of consciousness does not exist.”	Premature victory claim	“The starting distinction that makes this formulation seem compulsory can be examined.”
“The model proves everything.”	Shields the model from criticism	“The model offers an approach to examination; any conclusion must be argued separately.”
“Our method purifies experience.”	Implies an agent, value, and required outcome	“Experience may be distinguished differently when considered through the model; the model does not act on it.”

Ordinary organizing expressions—“level,” “sequence,” “analysis,” “let us turn to,” “first,” “then,” “within,” “structure,” and “system”—can describe the **organization of an explanation**. This organization should not be projected onto the phenomenon. When a philosophical passage is ambiguous, the distinction can be made explicit: “the order of exposition, not a sequence of existence.”

The coin analogy [AN]. Both attributing time to the phenomenon and attributing the “absence of time” may assume that time is a characteristic that must determine the phenomenon. The model does not have to select one side of that question. This does not turn talk about experienced time into a claim that clocks, memories, death, and sequences are absent from experience.

“Before,” “after,” and “appeared” in critical discussion [R]. Such expressions are legitimate for organizing a narrative, but do not thereby refer to processes in the phenomenon or the chronological origin of a concept. Asking “Where does this distinction acquire its characteristics?” can mean examining conceptual determinacy rather than locating an event in which a substance acquired a property.

7. A possible procedure for examining a particular case (neither a law nor a required outcome)

The following is one way of organizing research, not a process occurring within the phenomenon.

Step A. Preserve the initial statement rather than correcting it in advance: for example, “I see green,” “Anna is in pain,” “time passes,” or “nothing exists after death.”

Step B. Identify distinctions within the statement: “I,” “see,” “green,” “Anna,” “pain,” “after,” and “nothing.” This requires no independent agent of distinction.

Step C. Examine systems of distinctions: how each expression is determined by other distinctions, experiencings, and comparisons. Concepts are not treated as independently acting parts. **[AN]** The five theses are considered together; no isolated atom, first cause, originating moment, or unique mathematical graph need be found.

Step D. Ask whether an independent ground has been introduced. Has a name for a distinction been made into a claim that "there must therefore be a subject, time, space, object, or cause underlying everything"? An additional **premise is identified only if it is actually present** in the argument being examined.

Step E. If an additional ground is found, assess its role. What in this account requires introducing it? If nothing does, its necessity has not been established. Any substantive question that remains open after this analysis is still a question; it does not automatically invalidate the model.

Step F. Preserve experienced differences without introducing a "property of changelessness." Conceptual consideration does not make pain cease to hurt, the world disappear, people unreal, an instrument stop registering color, or responsibility vanish. **[AN]** Just as distinguishing brushstrokes does not erase the picture, examining something through the model does not create an operative force that transforms experience. The phenomenon itself does not become a substance with a newly attributed property of immutability.

Step G. Apply the same scrutiny to the analysis itself: its vocabulary, premises, and inferences, regardless of who conducts the inquiry.

Possible presentation: original assertion → distinctions → their mutual determination → additional ground discovered (**if any**) → content of the examination → open questions (**if any**). "No additional ground identified" is also an acceptable outcome, neither a failure of the method nor a victory for the model. Arrows show the order of presentation, not a process in the phenomenon. The outline is optional and belongs to work on the text, not to the model as such.

8. Examples: original and independent analyses

8.1. Green: distinction rather than an action by a concept [S]+[E]+[AN]

Original meaning: there is experiencing of green; green is distinguished by its greenness. "Greenness" is neither a property of some separate colorless substrate nor the cause of green's arising. No agent selects the boundary of green. Describing its color remains legitimate.

Common substitution: "First a subject receives an undifferentiated signal, then the concept of green extracts the color." **Accurate formulation:** "Green is distinguished as green; calling it 'green' adds no second entity to experiencing."

8.2. White light [E]

Light, colors, shapes, and images are not four independent substances, nor does the analogy put forward a physical theory of the light spectrum. It illustrates how one experiencing can be described through distinctions of color, shape, and image, **without causally adding new entities**. It does not require the historical existence of a stage of pure white light before distinction.

8.3. Noise [E]

Red and green, yellow and blue dots; a pattern, a field, stripes; structures and systems. **Differences are distinguished through the actual differences among their combinations**, not because a law or subject imposes order from outside. Noise, structure, and systems are not posited as successive stages of production. A description that does not rely on familiar time and space expresses the absence of their necessary ontological priority, not a physical theory of an image.

8.4. The "I," kettle, and philosopher [E]

These simple and sometimes self-ironic examples show that examining something through the model does not depend on the investigator's standing as a philosopher or the complexity of the subject. There is no requirement to replace them with "global consciousness," "quantum mechanics," or "intersubjective synthesis."

- **"I":** experiencing "I am," distinctions of "I/not-I," and systems including "mine," "with me," "this/that/there." No hidden owner need be discovered.
- **"Kettle":** an ordinary thing distinguished through shape, name, purpose, boiling, and everyday experience. This does not make the kettle "unreal."
- **"Philosopher":** "love of wisdom," "direction from lack of clarity toward clarity," "striving for clarity." Direction belongs to the example's conceptual content; it does not impose ontological time or objective improvement of the world.

8.5. Film [E]

A character, viewer, projector, screen, and cinema can all be **part of the film's own story**. They need not automatically be accepted as the external grounds of the depicted film. This is **an analogy of self-inclusion**, not proof that no material cinema exists in the physical world. No necessary meta-observer "outside the frame" should be added.

8.6. Dream [E]

A dream is described as a dream with distinctions of images and narrative; a character in the dream need not be its separate owner. The example illustrates the model's reach beyond the structure of everyday waking experience. It neither claims that physics is absent from every dream nor proves that waking life is a dream.

8.7. Doubt [E]

Doubt about the model, phenomenon, or experiencing is itself distinguished within experiencing. But this is **not a deductive guarantee** of the truth of every thesis. A critic may dispute the inference from the occurrence of doubt to the universal "everything." Self-application grants no immunity from external logical assessment.

8.8. Other universes [E]

"Other universes" is an intelligible conceptual description within experience, including thoughts of worlds with different laws. The model is not confined to the physics of one world. This does not prove the physical existence or nonexistence of other universes.

8.9. Anna and Boris [X]+[R]: an independent example, not from the original draft

Anna, Boris, pain, and reports of pain provide an independent research case, not an essential part of Model of the Phenomenon as originally written. The experiencings and the statements are distinguished; any hypothesis about separately distributed independent perspectives is assessed only where actually introduced.

8.10. Oil painting: distinguishing the picture and its brushstrokes without erasure [AN]

The analogy: within the experience of a painting, both the depicted scene and strokes of oil paint can be distinguished. Looking at the strokes does not erase the faces, landscape, or other distinctions in the image. What matters is the context of the examination—not a separate entity called "the image" hidden behind the paint, nor the elevation of paint into the model's supreme ontological cause. **[R]** The painting does not prove all five theses; the analogy must not silently install the materialist theory of a physical substrate that the position declines to introduce as its ground.

8.11. "God / hallucination / imagination": distinguishing truth without a supreme arbiter [AN]

The same experienced content can be described as divine, hallucinatory, or imagined within different conceptual structures. Neither the chosen word nor the coherence of the account creates a second entity "behind experiencing." At the same time, particular investigations, criteria, and disagreements remain meaningful distinctions within experience. **[R]** The model does not entail that all three accounts are equally probable, true, or without practical consequences; nor does it prescribe the opposite assessment.

8.12. Water, kettle, neighbor, and dream: no universal script prescribed by the phenomenon [AN]

Within a particular world, water, heating, and the expectation of boiling are distinguished. In a dream, a kettle might turn out to be a neighbor, and water need not behave according to waking physics. **Model of the Phenomenon neither sets rules of admissibility for these cases nor judges them by one external standard.** It does not claim that a person and kettle are physically interchangeable within ordinary worldly practice. Tests, errors, conclusions, and expectations belong to the relevant conceptual structures.

8.13. "The report was sent yesterday": analysis without compulsory error [C; R]

An independent test case [C; R], not included in the original work. "The report was sent yesterday" distinguishes a document, sending, communication, recipient, "yesterday," and a relevant temporal determination. This sentence does not, by itself, posit a temporal axis as an independent nature of the phenomenon. The analysis need not find a mistake: the statement may be an ordinary and perfectly appropriate reference to the past.

9. An atlas of the original work's seven subject areas

All the areas below are **fields of application**, not scientific theories proven by the five theses. The full scope of (A) is retained: the model is not reducible to the question of "subject versus consciousness."

9.1. Being [E: group 1]

Topics: the external world; matter; objectivity; reality and illusion; "I" and world; "we"; boundaries; the thing-in-itself; language; nonbeing and nothingness; emptiness; beginning; properties; "one"; self-application; causality, determinism, regularity, change, modality, first concept, fractal, systematic relations; finitude and infinity; time, space, "now," "here," and "there."

Typical error: independently existing first grounds are inferred merely from distinctions between objects or areas of experience.
Question from within the model: "Through which distinctions is this description given, and where is what is distinguished required to be an independent existent?"
Avoid: treating the conceptual character of "thing-in-itself" as a conclusive refutation of Kant; using the account of time to refute physical clocks; inferring the numerical identity of all things from the refusal of an initial ontological division.

9.2. Consciousness [E: group 2]

Topics: observation; perception; consciousness; states; content; location; "I am conscious"; the brain; subject and object; "I" as distinction; other minds; nonduality; owner of experience; solipsism; qualia.

Typical error: an owner, observer, or "inner screen" is introduced as the cause of experiencing itself.
Question from within the model: "Where are consciousness or the 'I' distinguished, and what is added when their independence is asserted?"
Avoid: giving the model a global omniscient subject; reducing the quality of pain to the word "concept"; attributing a separate soul to a rival philosophical position without checking its text; demanding an axiom of shared access to experiencings without demonstrating its necessity from the five theses.

9.3. God and religion [E: group 3]

Topics: soul; death; immortality; religion; prayer; miracles; karma; reincarnation; liberation.

Typical error: the sacred, soul, source of the world, eternity, or postmortem transition is introduced as an independently existing condition of the phenomenon itself.
Question from within the model: "What are the conceptual distinctions of life/death, address/response, cause/effect, and obstacle/liberation?"
Avoid: claiming proven immortality, denying biological death, declaring religions proven false, or equating the model with a particular Buddhist school.

9.4. Freedom [E: group 4]

Topics: free will; choice; will; motivation; cause and effect; purpose; action and agent; responsibility.

Typical error: a separate, already constituted subject, a freely causal will, or necessary causal determination is inserted as a first principle.
Question from within the model: "Through which distinctions are action, choice, consequence, responsibility, and their attribution described?"
Avoid: dismissing legal responsibility, practical decisions, or medical causal accounts simply because their vocabulary is conceptual.

9.5. Meaning [E: group 5]

Topics: meaning of life; preference and value; good and evil; justice; conscience; suffering; love; beauty; art.

Typical error: value, norm, moral bearer, aim, or "ought" is turned into a property of the phenomenon.
Question from within the model: "Through which relations among distinctions are meaning, agreement, preference, and suffering experienced?"
Avoid: saying pain is "merely a mistake in thinking," trivializing suffering, or inferring from the absence of a separate owner that people have no need to help one another.

9.6. Cognition [E: group 6]

Topics: truth and falsehood; delusion; error; proof; logic; knowledge; language; number; science; theory; understanding.

Typical error: a criterion of verification is elevated to a property of the phenomenon, or verification is dismissed altogether by the word "concept."
Question from within the model: "What distinctions and norms make it possible to say 'true,' 'mistaken,' 'verified,' or 'measured'?"
Avoid: granting the model immunity from criticism, equating consistency with proven ontological truth, or ignoring the actual robustness of scientific practices.

9.7. The Other [E: group 7]

Topics: development; progress; novelty; culture; society; power; artificial intelligence; learning; history; creativity.

Typical error: collective, agent, author, creator, progress, history, or artificial intelligence is treated as a necessary separate owner or source of experiencing.
Question from within the model: "Which systems of distinctions constitute 'society,' 'progress,' 'AI,' 'history,' and 'the new'?"
Avoid: denying the social consequences of actions; claiming experimentally to have proven either the absence or presence of subjective experience in AI; or reducing a historical fact to arbitrary fantasy.

10. A problem as a concept: examine its premises without mandatory dissolution

[AN; scope] The five theses **do not aim** necessarily to eliminate philosophical problems, identify false grounds, or purify experience. A particular inquiry may seek to clarify or remove an assumption, in which case its existence, meaning, and role must be shown. A different inquiry may simply examine the substantive structure of distinctions. The model itself changes nothing; a different approach to reading does not establish an active power of the model. See I.12 and II.8.13.

10.1. The model is **not obliged** to accept a problem exactly as framed in another philosophical theory. A "problem" is also distinguished conceptually. Merely asking a question does not make all its assumptions necessary grounds of the phenomenon.

10.2. If a particular inquiry sets out to examine or dissolve a problem, the following optional check can be used:

1. State the question exactly, without presupposing the answer.
2. Identify its distinctions and tacit assumptions.
3. Examine which assumptions require independent entities, observers, temporal stages, external causes, or modal necessity.
4. Determine whether any such assumption makes the proposed formulation obligatory. If none is found, report that result accurately.
5. **Only if** an unnecessary assumption is established, show why the question is no longer compulsory in precisely that form. Otherwise, do not declare the problem "dissolved" or invent an assumption.
6. Where the question remains meaningful in a particular world, scientific field, ethical context, or practice, explain how; otherwise, do not assume that it does.

10.3. Invalid move: "The problem is a concept, therefore it does not exist and has been solved."
Permissible move: "The problem as framed presupposes X. Model of the Phenomenon does not introduce X as a necessary ground. Without X, the necessity of that exact formulation has not been established."

10.4. "That problem does not arise for us" [AN]. If a starting assumption is not introduced, a particular formulation may not be compulsory within the adopted position. This is not proof that the other question has been solved under its own conditions. Where an inquiry asserts that a problem depends on an additional ground, it must provide an argument for that dependence; otherwise no search for such a ground is mandatory.

10.5. Intellectual boldness need not take the form of opposition to every other philosopher. Historical comparisons are legitimate when the positions are represented accurately and the comparison serves a clear purpose. Such comparisons are not conditions of the model's correctness.

10.6. Testing real understanding rather than repeating approved vocabulary [R; informed by C]

The following is a test of reasoning, not a new thesis or a report of anyone's actual experiencing.

Question: “To whom does the experiencing of pain belong?”

Distinctions in the question: “experiencing of pain,” “to whom,” and “belong.” The word “belong” invokes a relation of ownership, but merely using it does not establish a separate owner as the independent ground of pain.

Assumption worth testing: “For pain to exist, there must be an entity separate from experiencing to which it belongs.” This is a hypothesis about the question's possible structure, **not a belief to attribute automatically to everyone who asks it**. If “to whom” means identifying the person concerned in a practical situation rather than positing a substantial owner, the stronger assumption is absent.

Analysis: within the model, the experiencing of pain need not be derived from a separate owner. Distinguishing an “I,” saying “I am in pain,” recognizing another person, and communicating pain can all be considered within experience without positing an independent subject as an additional first principle.

What is no longer required: an explanation of *why pain would be possible only if a separate substantial owner existed*. This rejects the **necessity of a particular premise**, not the validity of saying “I am in pain.”

What remains: the difference between pain and a report of pain; the difference between “I am in pain” and “she is in pain”; medical and social approaches to recognizing a condition; and the need for care when making claims about another person's experiencing. None becomes indistinguishable merely because it is a “concept.”

What remains open in the relevant practice: how reports are verified in a particular case; how pain differs from a report; how claims about another person's experiencing are justified. A different substantive formulation may not require a substantial owner. **These are not holes in the phenomenon's properties that the model must fill**, but subjects for further examination of particular experience.

Failure test: “Pain is a concept, so the problem has been dissolved,” or “the question is external and therefore wrong,” **fails**: neither identifies the relevant assumption nor preserves the distinctions at issue.

10.7. Distinguishing the removal of a premise from refusal to discuss a question [R; informed by C]

If an inquiry seeks to test or remove a particular premise, the exact question, the independently posited ground (if actually present), its role, the distinctions that remain, and the limits of the result must all be shown. A premise absent from the argument must not be attributed to the interlocutor. Ordinary practical questions require no compulsory philosophical dissection. “It is a concept” does not by itself defend the model against substantive criticism.

10.8. “How is the position proved?” is not always an internal requirement [AN]+[R]

Within the adopted position, an assertion can be examined through already distinguished meanings, premises, and additional grounds. The possibility of interpreting an objection in this way **does not mean** its proponent accepts the first thesis or must regard it as proved. Three tasks must be kept separate: (a) demonstrating an internal mode of reading; (b) criticizing a particular inference in an interlocutor's argument; and (c) externally justifying the starting position. Success in (a) does not automatically establish (c).

10.9. Verification, criteria, and “fewer problems” without a universal law [AN]+[R]

The model makes no independent predictions and sets no universal scale of consistency. Within particular experience, consistency standards, success in testing, prediction, comparison with observation, religious interpretation, and the correction of errors are conceptually distinguished. **As one possible consideration [AN],** inquiry may ask whether a description introduces further problems, eliminates unnecessary ones, or corresponds to what is experienced. This does not establish the universal law “fewer problems means greater truth.”

11. Modes of inquiry (the operative account is in IV.3)

Exposition of the two works. For Model of the Phenomenon, the five theses [T] are the starting formulations, with definitions and explanations guiding their interpretation. In an exposition of Monophenomenalism, the specialized vocabulary of the model is not automatically mandatory. Terms from other theories—such as “perspective,” “for-me-ness,” metaphysical grounding, physicalism, information theory, temporal dynamics, an objective meta-space, or a specially introduced relation among different people's experiencings—require independent definitions and justification if used. Concrete examples of distinctions are particularly valuable.

Criticism and comparison. Legitimate questions include: What justifies the universal “everything”? Can immediate evidence establish a universal ontology? Does refusal to posit grounds make inquiry unfalsifiable? How should the

conceptuality of a representation be distinguished from the independence of what it represents? How does the position differ from idealism, phenomenology, or religious nonduality? **Such questions do not automatically establish missing axioms within the model** without an argument that the model itself demands them.

Formalization. Predicates, domains, inclusion relations, relations of systematicity, temporal axes, and assumptions about shared accessibility of experiencings among individuals require explicit meanings, domains, and justification for deriving them from the original text. Until their relation to the starting theses is justified, they are independent reconstructions [R] or external formulations [C], not hidden components of the model. A countermodel may show that a proposition does not follow from a chosen set of formal axioms; it does not automatically show that Model of the Phenomenon is incomplete. Formal notation, its interpretation, and the inference itself can also be considered distinctions within experience. A formally satisfiable construction does not establish the truth of its ontological reading.

Editing. Accurate exposition preserves the force of the source wording while distinguishing an adopted proposition, an internal examination, and independent proof. Refusing time as a ground must not be replaced with "we do not know yet," nor must "the phenomenon has no time" become proof of immortality. A research result is not predetermined and cannot be described as solving another position's problem before its actual formulation has been examined.

Comparison with philosophical traditions. External comparisons with Kant, Wittgenstein, Buddhist authors, Theodore Sider, Eli Hirsch, Amie Thomasson, Dan Zahavi, or David Chalmers require accurate accounts of the claims being compared. No tradition determines the meaning of the five theses in advance. Zahavi, for example, must not be assigned a substantial "I" without evidence; nor may every form of nonduality be equated with the position presented here.

12. Research questions and limits of justification

The following questions require close analysis of sources, further arguments, or careful clarification of terminology. Being open does not indicate a missing property of the phenomenon or license the addition of invented statements to the original works.

12.1. The starting "everything" and the scope of self-inquiry. The first thesis is adopted as a starting commitment. An independent reader may investigate arguments supporting its universal scope. The fact that doubt is expressed conceptually does not deduce the truth of the first thesis. Internal adoption and external proof remain distinct.

12.2. "One" as a concept and "one" as an ontological claim. The starting thesis must not become numerical monism. Nor should it be emptied into a tautology that overlooks its function of refusing independently established further grounds.

12.3. The symmetrical restriction on properties. "The model introduces no properties of the phenomenon" and "the phenomenon has no time" should be read with the clarification that negation does not establish the separate property of timelessness. Neither "the phenomenon is temporal" nor "the phenomenon is timeless by nature" is acceptable as an inferred attribute. The point is that conceptual time is not made an independent criterion for what the phenomenon is. The same applies to space, causality, necessity, beginning, end, and the negations of these terms. This does not demonstrate the impossibility of ontological inquiry under other positions.

12.4. "There is no pure experiencing" and the image of undifferentiated noise. The analogy must not be turned into a historical account of primitive nonconceptual material. Noise illustrates distinguishability, not evidence of an obligatory preconceptual state.

12.5. Recursiveness of concepts. The original draft states that each distinction is systematic and there is no final level. It does not define one mandatory mathematical structure. Trees, sets, fractals, or paradoxical foundations must not be imposed as the essence of a concept.

12.6. "Other minds are concepts" and other experiencings. An idea of someone else's experiencing is considered within experience. It does not follow that other people's pain is false or that one omniscient subject exists. A question from outside the model must not be made an internal requirement without explanation.

12.7. "Death is not the end of the phenomenon." Death as a concept within a world differs from assigning a temporal ending to the phenomenon itself. Individual immortality, endless temporal duration, and the denial of medical death do not follow.

12.8. Process vocabulary in the draft. The original uses terms such as "arises," "forms," "passes into," "changes," and "generates." Interpretations must distinguish ordinary grammar describing experience from an actual process imposed on the phenomenon. The latter should not be reproduced as an unquestionable doctrine.

12.9. "The problem is dissolved" and remaining distinctions. If the earlier formulation ceases to be mandatory, this does not prove that all empirical, normative, or phenomenal difficulties vanish. It should be made explicit **which premise** is no longer adopted.

12.10. "No ground." This must not be turned into a prohibition of all arguments or scientific explanations within experience. It refers to refusing an autonomous ground **of the phenomenon itself**. Arguments, evidence, standards, and causal explanations remain available modes of conceptual description of a world.

12.11. Different senses of "consistency" [C]+[R]+[?]. In (A), consistency is discussed in connection with understanding, logic, proof, scientific tests, and evaluative experiencing. These uses are not automatically equivalent. At least five distinctions may aid assessment: (i) internal noncontradiction of a formulation, (ii) agreement with what is observed in relevant experience, (iii) success of a testable expectation, (iv) justification of an inference, and (v) intelligibility and coherence of meaning. This is a research checklist, **neither five new entities nor a list claimed to be from the original work**. Any connection among the criteria requires argument. "Consistent" is not proof of the first thesis.

12.12. Pairs of feelings and evaluations [C]+[R]+[?]. In Model of the Phenomenon, love and hatred, pleasure and suffering, and beautiful and ugly function as examples. In each context it matters whether a local definition, illustration, hypothesis, or universal conclusion is intended. Coexisting feelings, the absence of an obvious opposite, and multiple directions of distinction can be investigated. None justifies silently changing the original formulation or declaring the five theses refuted without an argument.

12.13. Ontological adoption and the refusal to introduce [C]+[?]. It remains open precisely how the rule against introducing an independent support differs from adopting the starting proposition, "Everything that exists is a phenomenon. The phenomenon is one." Discussing that difference does not require attributing a positive or negative nature to the phenomenon. Possible answers need their own arguments and can be explored in particular cases.

12.14. Criticizing the map by its own standards [C]+[R]. Correct vocabulary does not establish understanding. Repeating "distinction," "not a ground," and "not a property" without showing **what is under examination and what has been clarified** risks an empty paraphrase. **Only when a premise is claimed to have been removed** must the analysis identify which premise it is. Finding none is not a failure of an otherwise accurate examination. Dismissing a critic's question as "external" without analysis is another error. What remains distinguished within experience and what remains open should be explained concretely.

13. Diagnostic checks K01–K18 (supplementary reference)

These questions target specific risks in comprehension and exposition. They need not be run mechanically for every reply, article, or discussion. Possible outcomes are *satisfied / violated / not applicable / insufficient information*. Rules for selecting them appear in IV.3–IV.4.

Code	Diagnostic question	Severity if violated
K01	When quoted, are all five theses verbatim and in their original order? Paraphrase, explanation, and criticism are permitted when distinguished from quotation.	Blocking
K02	Has an independent bearer of experiencing, "distinguisher," observer, or owner been introduced?	Blocking
K03	Are distinction and concept described as actions, causes, forces, or arbitrary impositions of characteristics?	Blocking
K04	Are time, space, cause, beginning, end, necessity, or process made properties of the phenomenon, including negated properties such as "timelessness"?	Blocking
K05	Has "one" become a number, container, absolute thing, positive or negative first principle, or property?	Blocking
K06	Is Model of the Phenomenon distinguished from a model of a specific world or universe?	Blocking
K07	Have experiencings, objects of experience, science, or practice been erased on the ground that "they are concepts"?	Blocking
K08	Have [T], [S], [E], [AN], [R], [X], and [?] been conflated?	Significant
K09	Is a figurative claim that a problem is "dissolved" presented as complete proof that the problem does not exist?	Significant
K10	**If** an inquiry claims to identify an unnecessary ground, is that ground accurately specified? If no such ground has been found or no removal claimed, is the requirement recognized as inapplicable?	Significant
K11	Has temporal immortality or a single subject been inferred from the first thesis?	Blocking
K12	Is the model, AI, and the text itself included in its self-application?	Significant
K13	Is the order of the five sentences projected onto the phenomenon as chronology?	Blocking
K14	Are examples involving green, light, noise, film, or dreaming used as physical proofs?	Significant
K15	Has intellectual boldness become an attack on philosophy or a set of unsupported assertions?	Significant

Code	Diagnostic question	Severity if violated
K16	Are open questions and places needing source context, argument, or separate definition identified?	Significant
K17	Is a “scientific discovery,” “theorem,” or “solution to consciousness” proclaimed solely on the basis of rearranged terminology?	Significant
K18	Are there concrete examples by which the interpretation can be tested, rather than declarations alone?	Desirable

If a substantial error occurs in a purported exposition of (A) from within the model, the exact formulation and shift of meaning should be identified. An openly identified alternative position advanced by a critic is not itself a failure to represent the source.

14. An optional outline for extended research

Extended inquiry begins by specifying its subject, task, available sources, and relevant explanations. Section IV.3 governs the choice of approach and assessment of understanding. The five theses are reproduced verbatim when quoted, but need not be repeated every time the subject is mentioned.

For each substantial section, when relevant to the task:

- The quotation or accurately located source statement [T]/[S]/[E]/[AN].
- What is being clarified within the model's vocabulary.
- What openly marked external comparison [X] is relevant and why.
- Where an entity, owner, time, space, cause, or process might be reified.
- What **does not follow** from the material presented.
- Which questions remain open and whether additional sources, definitions, or arguments are needed for the claim.

The result should answer the question being investigated. Significant checks, independent reconstructions [R], open questions [?], and specific disagreements with sources can be recorded as relevant. K01–K58 are selected by need, not completed for their own sake (IV.3–IV.4).

15. Marking provenance and degree of justification

Analytical prose need only distinguish quoted theses [T], original definitions [S-A]/[S-B], examples [E-A]/[E-B], explanatory notes [AN], independent reconstructions [R], and criticism [C]. Contested claims should also be evaluated by their supporting arguments: justified, tentative, open, or requiring further proof. Provenance and evidential force are independent. Every paragraph need not carry a label.

16. A brief reader's guide (the full rules are in IV.3)

If the originals are accessible, a full reading of Model of the Phenomenon and Monophenomenalism is desirable; independent introductory study through this map is also possible, provided the limits of source verification are acknowledged. Quotations of the five theses preserve their exact published wording. “One,” “phenomenon,” “experiencing,” “distinction,” “concept,” and “experience” do not designate separate entities or stages. Interpretation does not require a hidden agent, independent owner, or causal production of experience; it does not attribute positive or negative properties to the phenomenon. The categorical refusal of time, cause, and subject as independent grounds does not erase the differences of everyday life. The five theses prescribe no goal of finding an error or dissolving every question. Analysis considers concrete content and the mutual determination of distinctions without requiring ordinary language to be replaced by artificial philosophical prose. “It is a concept” does not prove the absence of the object. The original works, their propositions, independent hypotheses, and criticism have different statuses. Full rules appear in IV.3; K01–K58 are used as needed.

17. Navigating Model of the Phenomenon

When consulting (A) directly, semantic sections are more reliable than paragraph numbers in a particular file: “Terms”; “Model of the Phenomenon” and its five theses; thematic implications (being, consciousness, freedom, cognition, and other fields); “Model in One Line”; and examinations through light, noise, film, dreams, doubt, and other universes. Headings and their order should be checked against the edition actually being read on the author's site.

In reviewing an internal exposition, the reader should check that it does not require an independent entity or agent, temporal sequence of production, hidden cause, or other foundation of the phenomenon. This marks the boundaries of the adopted mode of inquiry, not a pre-established proof that every alternative philosophy is false.

PART III. DETAILED MAP OF THE POSITION OF MONOPHENOMENALISM

1. Purpose of this part and the position's independence from the full vocabulary of the model

Monophenomenalism is an independent philosophical work and is not reducible to the terminology of Model of the Phenomenon. It sets out a starting position and the reasons for considering it. Adopting monophenomenalism does not automatically require every special definition from Model of the Phenomenon (Sections 7.1 and 7.6).

Section 1.3 formulates the starting proposition as: **"Everything that exists is a phenomenon. The phenomenon is one."** "One" does not designate a numerically unique object. Refusing an independently established second ground does not prove that another position is impossible. The starting proposition remains open to independent philosophical criticism.

2. Ontological and methodological aspects: related but distinct

Ontological commitment [S-B]. Everything that exists is considered as one phenomenon. This is a commitment adopted within the position, not a universal theory already proved to every reader. It entails neither a single object or individual, nor a global knowing subject, fundamental substance, or one simultaneous perception of the whole world.

Methodological commitment [S-B]+[AN]. No independently established entity beyond the phenomenon is introduced as a starting explanatory principle. This refusal is substantive within the adopted position, but does not establish that "a second ground has been proved nonexistent." It is not doubt for doubt's sake: it is a discipline of inquiry that declines to install unestablished supports in advance.

Limit of inference [S-B]. "All assertions available to us are formulated within experiencing" does not entail "everything that exists in reality is identical with experiencing." The draft of (B) explicitly recognizes this boundary (2.1–2.4). It must be retained even in rigorous internal uses of the five theses.

Clarification of the starting commitment [AN]

Monophenomenalism is not motivated as a gradual economy of premises turned into an ontology. It is a **position adopted at the outset**: everything is one phenomenon, without positing an independent second ground. External justification of that commitment is another question; the epistemic argument in (B) is not a deductive proof of the first thesis. The clarification sharpens the difference between ontological adoption and a temporary methodological "we shall not introduce it yet," **without claiming** that "one" is a separate entity with established properties. Conceptual expressions—including "position," "adoption," and "ground"—do not exist outside experience as an operative mechanism.

3. Three premises in (B) and their strictly limited conclusion

(B), 2.1: There is experiencing; doubt about experiencing is itself presented in experiencing. **(B), 2.2:** Accessible assertions about the world, matter, subject, or external are formulated within experiencing. **(B), 2.3:** Accessible verification and justification are likewise presented within experience; one cannot establish independence by literally occupying a standpoint entirely outside all experiencing.

The limited conclusion: description and testing take place within experience; caution is warranted about an absolutely external standpoint of verification. **What does not follow:** unreality of objects, invalidity of science, impossibility of indirect arguments for realism, or the deductive truth of monophenomenalism.

(B) explicitly recognizes indirect arguments, stable observations, and predictions (2.3). The impossibility of a completely external standpoint must not be inflated into the impossibility of *all* forms of justification.

Language qualification. (B) sometimes refers to "an act of thought," "verification taking place," or "the investigator adopting a position." These are ordinary academic expressions about reasoning, not the addition of an ontological agent, process, or clock to the phenomenon. An exposition must distinguish grammatical usage from ontological commitment.

4. What the position does and does not claim (B, Section 3)

Adopted: everything that exists is considered as one phenomenon; no independent second principle is introduced as a necessary support; particular descriptions require additional arguments. The position does not predetermine all distinctions within the phenomenon or impose a single structure of world, physics, ethics, religion, dream, or waking life.

Not derivable: "only my consciousness exists" (solipsism), "matter does not exist," "the real world is an illusion," "all people are identical to one object," "all experiencings are available to one center," "personal immortality is proved," "scientific testing is impossible," or "the model replaces every other theory."

A subtlety concerning negation. "Monophenomenalism does not claim X" states a limit of **the work and its position**. It does not conclude that ¬X is a metaphysical property of the phenomenon. A categorical "there is no time" in (A) should not be rendered as the ontological claim that "the phenomenon is timeless by nature."

5. How monophenomenalism differs from the model, and how it does not

Common ground: neither work accepts an independent external bearer or an original division between the phenomenon and another fundamental ground. Neither requires a separate subject-owner as its foundation. Both admit examination and employ concepts within the experience under discussion.

Different emphasis: (A) presents the specific vocabulary "sensory experiencing–distinction–concept–experience," a five-sentence formulation, its recursion, and examples. (B) expresses a more general philosophical commitment, investigates its justificatory limits, and compares it with other theories. **Accepting (B) does not automatically entail adopting the definition of "concept" in (A)** (B, 7.2–7.6).

The works have different purposes: Model of the Phenomenon offers a specific conceptual vocabulary; Monophenomenalism formulates the philosophical position more broadly. They do not concern different ontological worlds, and neither is a subsequently proved product of the other.

6. Comparing (B) with philosophical traditions (Section 4)

Approach discussed in (B)	Legitimate focus of comparison	Inappropriate substitution
Monism	Meanings of "one," existence, and fundamentality	"All forms of monism are the same," or "monophenomenalism is not monism by definition."
Phenomenalism	Describing objects through sensations or possibilities of sensation	"Every object is a separate sensation," without support in the definitions and premises actually being examined.
Neutral monism	Whether a neutral underlying nature is posited	Inserting a new neutral substance into the position
Advaita Vedānta	Specific commitments concerning Brahman, Ātman, and liberation	Claiming complete identity or proven superiority
Idealism	Mind or spirit as a possible first principle in different versions	Attributing a universal thinking subject to (B)
Phenomenology	Experiencing and descriptions of givenness	Claiming all phenomenology assumes two substances
Radical constructivism	The role and structure of cognitive schemes	"The knower constructs the phenomenon itself."

External literature should be used for specific questions and checked against the relevant sources. Another school must not be imposed as the language of internal exposition. The introduction of a new term does not prove originality: (B) itself acknowledges an earlier related use by Fritz Heinemann (3.5). That bibliographical observation is reported from the original work, not offered here as an independent verification.

Limit of philosophical comparison [AN]. Model of the Phenomenon is not obliged to resolve other theories' problems within those theories' premises. Comparison remains possible where the positions and their grounds are explicitly specified. Success at comparison does not determine the model's truth.

7. Particular examples in (B): status and limits (Section 5)

External world. It is not introduced as an independent source of the phenomenon; neither does "the world is illusory" follow. Every proposition about independence is assessed within experience, but the object spoken about is not automatically identical to the word or thought representing it.

Subject. "I," "mine," and "other" are conceptual distinctions in (A); within (B), the absence of a fundamental owner does not prove the absence of people. A hypothesis of jointly accessible experiencings for different people requires separate justification and is not a starting axiom of monophenomenalism.

Death. Death is distinguished within the world of living and experience. Refusal to give the phenomenon a temporal boundary does not turn it into the property of being "eternal" or prove personal immortality. Nor can "no postmortem experiencing is possible" be derived without premises.

Causality and cognition. A cause within experience does not become the necessary ground of the phenomenon itself. Scientific causal models of the world are not thereby disproved. "The absence of a cause of the phenomenon" must not become an established absolute characteristic of what exists.

8. Objections and how to examine them (Section 6)

"Is this solipsism?" Not if solipsism means positing a single fundamental personal "I." But that answer does not prove the existence of every possible other mind. Concrete distinctions should be examined rather than merely replacing one label with another.

"Is this unfalsifiable?" (B) makes no independent experimental predictions; logical, conceptual, and comparative criticism remains possible. A universal ontological thesis lacking a direct experimental falsification test is not entitled to make logical errors.

"Is it a tautology?" The universal "everything" may operate as a definition. The substantive commitment is the refusal to *require* a second independent ground. This is a philosophical choice, not an automatic refutation of realism.

"Why one?" Within the position, "one" is neither a number nor a substance. External critics may still question the universal ontological commitment; "the question is itself a concept" is insufficient as a formal deduction.

"What does it contribute to science?" Not new physics or an experimental test, but a way of examining the initial conceptual commitments of scientific discourse while retaining scientific practice.

"Is it merely a new name for an ancient tradition?" Only detailed comparison of commitments can answer this. Neither absolute novelty nor automatic identity with idealism, Advaita, or phenomenology is established in advance.

9. Four statuses of implications in Monophenomenalism (Section 7.4)

Section 7.4 distinguishes four statuses of implications. Their exact meaning is fixed by that section of the source, and an additional classification should not silently replace it:

1. Follows directly from the position, without additional propositions of the model.
2. Follows within the model, when monophenomenalism and the model's additional propositions are accepted.
3. Is compatible with the position but does not follow from it; independent justification is required.
4. Contradicts the position **or** requires clarification.

The fourth class combines two distinct cases that may be separated analytically. Adding categories would then be a research reconstruction, not a quotation from (B). The force of each implication depends on its premises.

10. Logical criticism of (B) without imposing an external ontology

Questions to check include: What is adopted as the starting proposition? What provides epistemic motivation? Which definitions are added? Where does an opponent's argument introduce an independent ground? Are "everything," "phenomenon," "external," and "experiencing" used consistently? Is compatibility mistaken for entailment? An external question need not refer to an independently existing object, but substantive objections to the universal scope of the thesis remain possible.

Boundary between internal and external inquiry. Refusing to regard time as an independent nature of the phenomenon does not impose on the model the internal duty to "explain the nature of time." Failure to answer a question built on a premise not adopted by the position does not itself refute the position. Whether that refusal suffices in a particular investigation may nevertheless be criticized independently. It matters which thesis is being examined and what premises the inquiry employs.

11. Relating (B) to the explanatory notes

- Monophenomenalism distinguishes the methodological refusal to introduce an independent ground from the starting ontological commitment. The symmetrical rule in the map explains why neither the presence nor the absence of time or cause becomes a property of the phenomenon under the adopted interpretation. This guides reading without replacing the content of (B).
- In (B), "ground" can refer to an argument or the starting proposition of a philosophical paper. An independently existing *ground of the phenomenon* would have a different status: an ontological support posited behind distinctions. The meanings must not be conflated without attending to context.
- (B) permits philosophical comparison and other methods of inquiry. Internal investigation need not adopt external formulations of problems as its own compulsory tasks. The possibility of comparison does not make it a condition of the position.
- (A) contains categorical formulations concerning the absence of time and beginning. In interpreting them, negation must not become a positive or negative property of a hidden thing. Literal quotations of both works retain their exact wording.

12. Preparing an independent article or investigation

An independent inquiry can move from the five theses to distinctions involving the "I," kettle, philosopher, light, noise, film, dream, death, and cause. An independently posited ground is examined only where a particular argument actually invokes it. The issue is whether the ground is necessary for that case or has been imported. Rigorous inquiry need not make questions about a separate subject, ownership of experiencing by a perspective, or common accessibility of experiencings among individuals mandatory internal tasks of the model.

Accuracy matters more than reputational agreement or rhetorical victory. The starting position need not be weakened artificially to satisfy an imagined reviewer, but disagreement with a philosophical tradition does not by itself disprove that tradition.

13. Navigating Monophenomenalism

For orientation, use the source's own section headings: starting proposition, motivation for adopting the position, limits of justification, relations to scientific and practical descriptions, comparisons, objections, and the status of implications. A reference such as "Section 7.4" is meaningful where the edition used has that structure; file-specific paragraph indexes are not part of the philosophical content.

PART IV. GUIDE TO WORKING WITH THE TWO ORIGINAL TEXTS

1. Shared glossary: checking both positive and negative attributions

Scope of the glossary [R]. The table is a navigation aid, not proof that the two works define every term identically. The specialized meanings of "sensory experiencing," "distinction," "concept," "structuring," and "experience" belong primarily to Model of the Phenomenon. The starting proposition and terminology of Monophenomenalism should be determined from its Sections 1.3, 3.1, and 7.2. Every additional clarification retains the status identified elsewhere in the map.

Term	Working meaning in (A), (B), and their explanations	Not to be added as a hidden ground	Not to be attributed as a negative property
Phenomenon	Original designation of everything that exists; not a second thing behind experience	Absolute substance, container, meta-object	"Absolute immateriality," "beyond nature," or "total absence of properties" as its nature
One	Itself a concept; refusal to require an original independent division	Numerical identity of all objects; global observer	Ontological impossibility of any distinction
Sensory experiencing	Sensations, emotions, thoughts, experienced states; no required owner	"Internal state of a separate soul"	Proof that no other description of the world is possible
Distinction	How experiencing exists as distinguished; not an operation	Distinguishing subject, act, mechanism	"Absolute indivisibility" as an inherent property of the phenomenon

Term	Working meaning in (A), (B), and their explanations	Not to be added as a hidden ground	Not to be attributed as a negative property
Concept	A system of distinctions; not merely a word and not a separate agent	Mechanism producing experiencing	Proof that a concept's object does not exist
Structuring	How concepts are described as experience	Chronological processing of raw material	Proof that no real changes occur in a world
Experience	The phenomenon structured through concepts	Final product of another substrate	A separate primordial world of "phenomenon without experience"
World	Distinguishable experience of a particular environment, life, dream, film, and so on	Absolute origin of the phenomenon	Nonexistence of the practical world
I	A system of distinctions such as "mine," "not mine," and "to me"	Fundamental owner of experiencing	Absence of people's actual experiencings
Time	Conceptual account of succession within a world	Necessary axis of the phenomenon	Natural "timelessness" of the phenomenon
Space	Conceptual boundaries and relations within a world	Container of the phenomenon	Natural "spacelessness" of the phenomenon
Cause	Relations described in experience; a practical explanation in science	First cause of the phenomenon	Proof of metaphysical causelessness
Necessity	A conceptual modal distinction	An absolute law of what exists	"Absolute chance" as a property of the phenomenon
Death	Distinctions of life and death, cessation of an organism, loss	Temporal condition of the phenomenon	Personal immortality or metaphysical immunity from death
Truth / verification	Norms and practices within experience available for inquiry	Guarantee of the five theses' truth	Abolition of science or standards of testing
Monophenomenalism	Starting position of one phenomenon, with no independently established second ground	Self-proving cosmology	Exclusion of external criticism by definition
Model	A self-applying conceptual distinction; a research tool	External law, ultimate essence	Proven uselessness of all other descriptions
Problem	A conceptual question whose starting assumptions may be examined	An objective gap in the phenomenon that the model must fill	Proof that no practical difficulties exist
Ground	The logical premise, research motivation, and independently posited ontological support must be distinguished	Equating the different senses	Prohibiting all logical justification within experience

2. A central warning: do not split the terminology into separate entities

"Phenomenon," "experiencing," "distinction," "concept," and "experience" **do not designate five parts of a system that must subsequently be connected**. (A) explicitly explains that the division is needed by the text. Each term distinguishes what already exists. Changing terms does not describe a metaphysical transformation or a successive appearance of different things.

The exact fourth thesis is **"Concepts structure the phenomenon into experience."** In paraphrase, this must not become a causal mechanism. Green is green as distinguished; the word "green" does not color experiencing or separate greenness from an independently existing green substrate.

3. General rules for reading, application, and criticism

The principal task is to understand, investigate, and accurately represent the claims of Model of the Phenomenon and Monophenomenalism, distinguishing original texts, explanations, independent reconstructions, and criticism. Claims are assessed by arguments and the appropriate criteria of inquiry, not by the author's name. Rules for using this guide neither add properties to the model nor give it new purposes.

The approach depends on the task: exposition of Model of the Phenomenon, exposition of monophenomenalism, analysis of a case, editing, criticism, comparison, or formalization. In complex work, the chosen approach is worth making explicit. An internal exposition cannot silently substitute an alternative hypothesis for the model's commitments; external criticism may employ one openly. Ordinary practical questions need no artificial philosophical procedure.

The specialized vocabulary of the five theses in (A) does not automatically apply to every sentence in (B). The latter's starting proposition, the limits of its argument, and the possibility of other research approaches must be preserved.

General principles:

1. Substantive inquiry into both works should, where possible, consult the author's website and accessible publications (I.1), establish the editions being used, and check the passages relevant to the question. If the site is unavailable, Zenodo, PhilArchive, or supplied copies may be used. If the current edition cannot be identified, the publication actually used should be specified without claiming it is the latest. If the originals cannot be accessed, provisional inquiry within the map's limits is permissible with a clear note that quotations and contexts could not be checked. An inaccessible source must not be represented as read. A question about a particular edition requires consulting that edition. For repeated local tasks, checking the relevant passages suffices.
2. When quoted, the five theses are reproduced exactly, without introducing a sixth proposition about the "I," time, subject, systems, causality, perspectives, or necessity.
3. An accurate exposition does not introduce as an independent first principle an agent of distinction, owner of experiencing, world behind the phenomenon, time, space, cause, mechanism, or property of the phenomenon. The rejection of each must not become an opposite property.
4. Monophenomenalism is understood as an adopted starting philosophical position, not as a deductive result of "there is experiencing." Model of the Phenomenon is not the only possible language for that position.
5. Examination of a question focuses on the distinctions through which its content is determined. No result is fixed in advance: no additional ground may emerge, the question may remain open, and experiencing need not change. The mere presence of words such as "I," "cause," "necessary," "independent," or "real" does not establish an independent ground; the assertion's meaning matters. If such a ground is actually posited, the inference to it must be identified precisely. Otherwise the premise must not be attributed to the speaker. Ordinary language need not be replaced with artificial constructions.
6. Examples from Model of the Phenomenon retain their concrete content: green, light, noise, "I," kettle, philosopher, film, dream, doubt, and other universes. They illustrate inquiry rather than serve as physical proofs or complete theories.
7. External criticism examines validity, premises, and the limits of particular arguments. Self-application does not prove the first thesis to every opponent. Comparison with other philosophies is permissible but not compulsory; the claims and evaluative criteria under discussion should be precisely specified.
8. For a consequential contested claim, the status [T], [S-A], [S-B], [E-A], [E-B], [AN], [R], [C], or [?] may be marked explicitly or stated in words. Explanatory notes do not alter the source's literal text.
9. Completed inquiry answers the task posed. Important differences from sources, independent premises, and open questions are identified as relevant. Original quotations are not rewritten as editorial improvements. Independent development may produce new examples, distinctions, hypotheses, counterexamples, comparisons, and critical arguments. Their provenance is marked [R]/[C]; they do not automatically become statements from the original works or necessary implications of the five theses. An asserted entailment must be supported by definitions, any additional premises, the reasoning, and its limits. A new conclusion may be justified independently; attributing its wording to the original author requires reliable textual or other evidence of provenance, which cannot substitute for proof.
10. In checking understanding or carrying out philosophical analysis, a useful outline is: exact proposition → relevant distinctions and their mutual determination → any additional ground → what has been clarified and what remains unproved. A claimed dissolution of a problem must specify the limits of the result. Evidential force is determined by the argument, not the vocabulary: "X is a concept" does not by itself prove X false, erase its referent, or resolve the question.
11. Formal texts, notation, reading, and logical checks are likewise considered within experience. Formal conclusions are assessed relative to accepted premises and do not become properties of the phenomenon without further argument.
12. A new philosophical examination takes all five theses together. Mutual determination of distinctions does not require a first cause, originating moment, final atom, or mandatory sequence of recursive stages. The order of analysis organizes an exposition, not the phenomenon.
13. The choice between asserting and denying X is not compulsory where the question about X itself imposes a characteristic not accepted as applying to the phenomenon. Within particular systems of distinctions, X and ¬X retain their own content.
14. Verification, correctness, error, scientific explanation, and logic also occur within conceptually distinguished experience. They must neither become universal properties of the phenomenon nor be cancelled within the practices to which they belong.

15. Comparisons with other philosophies, and examples involving God, film, dream, or painting, do not prove the first thesis or make external questions obligatory tasks for the model.

An inquiry may end when its specific task has been met, significant distinctions have been explained, and relevant uncertainties have been identified. This is the completion of a text, not an end to relations among distinctions. A question already clearly addressed by the map need not be reopened without new reasons. The short checks in IV.4 and relevant diagnoses from K01–K58 can be used for self-review. Available assessments are *satisfied / violated / not applicable / insufficient information*. A separate checklist table is not necessary unless the task demands one.

Insufficient support for newly added elements. A critical question alone does not require a new axiom; ontological relations do not follow merely from a demand to answer a problem posed under different premises; and the mathematical independence of an artificially introduced symbol does not establish the inadequacy of the phenomenon or the original model.

4. A short self-check and supplementary diagnostics K01–K58

Short self-check: (1) theses and quotations are accurate; (2) no external grounds, agents, or properties of the phenomenon—including negative properties—have been attributed to the position; (3) (A) and (B) are not conflated; (4) "distinction," "concept," and "is" are not converted into mechanisms; (5) substantive differences within experience remain; (6) no compulsory unmasking or dissolution is imposed; (7) sources, explanatory notes, research reconstructions, and external criticism are distinguished; and (8) the force of an inference matches the task and its stated premises. Every response need not publicly report on all of these items.

K01–K18 appear in II.13; K19–K58 follow. Each inquiry uses only the questions relevant to its task. Inapplicable checks do not indicate an error. An explicitly external assumption is allowed if it is not attributed to the model without argument.

Code	Diagnostic question	Severity if violated
K19	Has a **negative property** ("timeless," "causeless," "unchanging") been attributed to the phenomenon instead of simply declining to introduce that concept as a ground?	Blocking
K20	Has the model's own word "one" been treated as indicating a genuine numerical property or a property defined by negation?	Blocking
K21	When verification or an accurate exposition of (A) and (B) is claimed, were the relevant originals and editions actually checked? When using the map alone, is the absence of the originals or direct verification acknowledged? Lack of access does not preclude answering within the map's limits.	Blocking for a false claim of source verification; otherwise context-dependent
K22	Are monophenomenalism as a philosophical position and the model as a specific instrument distinguished (B, 7.1–7.6)?	Blocking
K23	Have the epistemic premises in (B) been presented as a strict proof of the ontological "everything"?	Blocking
K24	Have relations between perspectives introduced by the researcher, an assumption about shared access to experiencings, or a graph of systematicity been turned into compulsory propositions of the model?	Significant
K25	Have the four statuses of implications in Monophenomenalism (Section 7.4) been conflated with an added research classification?	Significant
K26	When interpreting negations, is it clear that they limit the language of the position rather than describe the nature of the phenomenon?	Blocking
K27	Have medical, social, moral, scientific, or everyday distinctions been abolished because "everything is a concept"?	Blocking
K28	Is the origin of a newly introduced problem identified, together with the assumptions it adds beyond the sources?	Significant
K29	When adding an explanatory note [AN] to the map, have its exact wording, reliable source, domain of application, and tentative or final status been established? This is inapplicable to ordinary study; no separate editorial change log is required.	Significant when editing the map; otherwise not applicable
K30	Has an independent research hypothesis been presented as a verbatim or definitively established original claim without evidence of its provenance?	Blocking
K31	Have formal notation, text, or reasoning been excluded from experiencing as if they were ontologically "not experiencing"? Are the notation and the truth of its interpretation distinguished?	Blocking
K32	If an independently existing ground is said to have been identified, has it been specified accurately? If none is found, is the result stated without inventing an assumption? Otherwise this check is inapplicable.	Significant
K33	Are substantive differences within experience preserved? If a premise is said to have been removed, have the limits of that result and what remains been identified? If no removal is claimed, the latter requirement is inapplicable.	Significant

Code	Diagnostic question	Severity if violated
K34	Have distinct criteria of consistency been confused, or thematic pairs and examples made into universal proved laws?	Significant
K35	Are quotations, independent criticism, and research proposals distinguished? Is use of the guide being misrepresented as independent proof of truth?	Significant
K36	Has “is” been interpreted as attributing the property of experiencing to a subject called “the phenomenon,” making “experiencing” its quality or manner of manifestation?	Blocking
K37	Has monophenomenalism become a gradual effort to minimize assumptions rather than a position adopted from the outset?	Blocking
K38	Has the model's internal applicability to its own denial been presented as a universally valid proof of its truth?	Blocking
K39	Have formulations such as “the phenomenon is unchanging” or “has no cause” been read as properties of an unchanging or causeless substrate?	Blocking
K40	Has the model been turned into a law standing above worlds, prescribing the boiling of water, physical laws, the structure of dreams, or the truth of concepts?	Blocking
K41	Are possible criteria of consistency and reduction of research problems distinguished from an obligatory universal criterion of truth?	Significant
K42	Have thematic examples been treated as strict theorems not entailed by the five theses?	Significant
K43	Has the disappearance of a verbal division been read as the disappearance of immediately experienced distinctions or as a temporal process in the phenomenon?	Blocking
K44	Has “Does the phenomenon have X?” been made a compulsory choice between two poles, even after the assumption that X must characterize the phenomenon has been rejected?	Blocking
K45	In examining a claim, are a first cause, originating instant, indivisible atom, or mathematical graph being sought automatically and then mistaken for the phenomenon?	Significant
K46	Has an opponent been attributed acceptance of the first thesis merely because their words can be described within the model?	Blocking
K47	Has an external comparison of traditions become an obligation to solve their problems under their initial assumptions?	Significant
K48	Have the content and practical distinctions of a world been erased after identifying their conceptual structure (as in the painting and brushstrokes example)?	Blocking
K49	Has the model been presented as one law governing permissible worlds or a universal standard for successful prediction and consistency?	Blocking
K50	Has the conceptual status of verification been made to imply that competing claims are equally true, false, or exempt from practical tests?	Blocking
K51	Are explanatory notes [AN] on Q1–Q8 distinguished from independent reconstructions [R] and propositions with genuinely established scope?	Significant
K52	Has the use of “is,” “changes,” “arises,” “determines,” or “structures” introduced an independent agent, entity, or chronological process?	Blocking
K53	Has the model **itself** been assigned the goal of necessarily dissolving questions, eliminating grounds, or improving/changing experiencing? Are the tasks of a text being confused with the five theses?	Blocking
K54	Can an inquiry end without finding an error or unnecessary ground, without being declared unsuccessful?	Significant
K55	Has recursive systematicity become a tree of independent branches, a chain of stages, chronological becoming, or separable atoms?	Blocking
K56	Has the mutual conceptual determination of “past” and “future” been made into an event in the phenomenon, a spatial relation, or a metaphysical law?	Significant
K57	Do categorical negations retain their force without weakening them to “we do not know yet” or turning them into properties of a supposed entity?	Blocking
K58	**For editing the map:** are internal references accurate? **For testing the method with examples:** is a legitimate analysis shown in which no problem is compulsorily dissolved? Otherwise: not applicable.	Significant

If a text claiming to be an accurate exposition of (A) or (B) contains a substantial distortion, its exact wording and the difference in meaning should be identified. An external critic is free not to accept the position, and a short practical answer need not include a philosophical investigation.

5. Presenting research results

A useful result answers the question posed, accurately references the available original works, indicates the limits of its conclusions, and includes independent reconstructions or open questions where relevant. Quotations are verbatim; source formulations and editorial interpretations are not conflated. Brief tasks do not need an extended report on every diagnostic check.

6. Consulting original works and using the map independently

- **Original works:** The primary source is the author's website. Additional Russian and English publications on Zenodo and PhilArchive are listed in I.1. Accurate textual verification requires access to the relevant text and identification of the edition actually used. An edition of unconfirmed currency must not be called the latest. If an original is inaccessible, investigation within the map's limits remains possible with the absence of direct verification clearly stated.
- **Discrepancies between editions:** Where a newer edition of an original differs in meaning from a statement in the map, the relevant passages should be compared. An earlier interpretation does not bind a new publication simply because it appears in the guide. Literal wording of each particular edition is nonetheless preserved in quotations.
- **Status of the map:** The map adds no independent ontology to the two works. Its statements have different origins and evidential force: quotation, explanatory note, reconstruction, criticism, and open question. The distinction is essential for independent inquiry by both human readers and AI systems.

7. Research questions Q1–Q8: content and limits

Q1 — time and both sides of negation [AN; ?]. Time and its absence are distinguished through concepts in particular experience. Neither “temporal” nor “timeless by nature” becomes a necessary property of the phenomenon. Brief categorical language is acceptable where its sense and limits are made explicit. The most precise forms of exposition in different research settings remain open to discussion. See I.11.1.

Q2 — systematicity and its description [AN; ?]. Any assertion can be considered through the five theses, but systematicity is not identical to a graph, independent branches, or a sequence of stages. Distinctions described as “past” and “future” may mutually determine experience without any causal event of the phenomenon. Further inquiry may clarify criteria for substantively adequate descriptions of systematicity. See I.11.2 and II.7.

Q3 — internal describability and external justification [AN; ?]. Another philosophical position can be considered as conceptually determined within the model, but this does not prove its adherent accepts the first thesis. Justification of the initial commitment for a reader who disagrees remains a subject for independent investigation. See I.11.3.

Q4 — comparison of philosophical premises [AN]. The model is not required to solve the problems of a different theory under that theory's starting assumptions. Explicit comparison of particular premises is possible, but it is not an internal condition for the acceptance or intelligibility of the five theses. See I.11.4.

Q5 — preservation of distinguished content [AN]. Examination need not alter experiencing or resolve a question. Particular experience retains its differences. Strokes of oil paint do not erase the picture, and attention to conceptual distinctions does not deprive the world, pain, or other experiencings of content. See I.11.5 and II.8.10.

Q6 — argument in independent discussion [AN; ?]. Analysis need not be a contest between fully formed ontologies: the exact assertion, its distinctions, and its premises can be examined. Lack of agreement does not automatically refute the model, but the ability to analyze a statement conceptually does not establish the model's truth for the other participant. See I.11.6.

Q7 — standards of consistency and testing [AN; ?]. Consistency, truth, and error are distinguished through concepts of particular experience; the model does not prescribe physical laws, the rules of dreams, or one scale of truth. Particular testing practices remain subjects of inquiry. This does not entail equivalence of incompatible claims. See I.11.7 and II.10.9.

Q8 — limits of thematic examples [AN]. Examples in Model of the Phenomenon are not to be treated as universal laws governing their respective subject areas. When examining categorical expressions, their literal content and degree of justification must remain distinct, without retrospectively rewriting the source. See I.11.8.

Final reminder. This map supports understanding and inquiry, but is not an independent ontological ground, an external law governing the phenomenon, or a set of further theses. Refusing a property does not become a property; “one” does not become an object; “concept” does not devalue what is distinguished; and analysis need not be arranged to discover an error or dissolve a problem in advance.
